Introduction

The 109 mi² Malibu Creek watershed is the second largest subwatershed within the larger 414 mi² Santa Monica Bay watershed. It provides a wide variety of habitats for countless species (marine, animal and plant) and has long been a popular place for surfers, hikers and other outdoor enthusiasts. Surfrider Beach, famous for its surfing break and visited by 1.2 million people annually, is one of the most popular tourist destinations in the area. The watershed is also home to two federally listed endangered species – the tidewater goby and steelhead trout. As one of the few remaining coastal wetlands in Southern California, Malibu Lagoon is a critical stop-over for migrating birds along the Pacific flyway.

While open space predominates the region, residential and light commercial land uses, orchards, pastures, crops, natural areas and golf courses account for approximately 19% of the area. The watershed encompasses unincorporated portions of Ventura¹ and Los Angeles Counties, and seven cities -- Malibu, Calabasas, Agoura Hills, Thousand Oaks and Westlake Village and small portions of Simi Valley and Hidden Hills. Combined, these communities are home to more than 90,000 residents. Population growth within this region increased at a significant rate during the 1980s (10%), but slowed somewhat during the 1990s (2%). The current growth trend is expected to continue (see Figure 1).

---

¹ Ventura’s unincorporated communities include Oak Park, Lake Sherwood and Hidden Valley.
In 1995, the Santa Monica Bay Restoration Project (SMBRP) completed the *Bay Restoration Plan (BRP)* which, among other elements, included a draft action plan for the Malibu Creek Watershed (MCW). The *Malibu Creek Watershed Natural Resource Plan*, released soon afterward by the Natural Resources Conservation Service, addressed watershed resources, water quality and quantity issues, and pollution reduction strategies. It also contained an appendix of 44 action items which paralleled the actions identified in the BRP.

These 44 actions, consolidated down from an original list of 111 actions, were developed and agreed upon by watershed stakeholders through a consensus approach organized by the SMBRP. These 44 actions now provide the framework of guiding principles for restoration of the Malibu Creek watershed and comprise the Bay Restoration Plan’s Malibu Creek Watershed Action Plan. They focus on six key areas of concern:

- Overall water quality and quantity
- Malibu Lagoon and surfzone
- Solid wastes and other wastes
- Land use
- Habitat protection and restoration
- Coordination and outreach

The entire process undertaken to guide restoration activities in the Malibu Creek watershed served as a subwatershed “pilot program” for Santa Monica Bay and could also serve as a model for other watersheds considering similar efforts. Key elements of this model include convening a stakeholder group, reaching consensus on the issues through stakeholder involvement, identifying the most significant pollutants of concern impacting the watershed’s habitats and resources, developing restoration/protection management options, securing funding and ultimately, taking action.

The following report highlights the successes and challenges of this pilot program over the past six years, although some elements began before 1994. It contains four sections:
• **Section One: Overview**, highlights the structure of stakeholder involvement in the watershed and provides brief summaries on: 1) sources of impairments to water quality, 2) other problematic issues, 3) human health risks and habitat degradation and 4) watershed studies and projects.

• **Section Two: Action Plan Update**, provides an in-depth update and assessment of the Natural Resource Plan’s 44 action items (BRP actions).

• **Section Three: Key Findings**, summarizes the key findings of the data presented in Section Two.

• **Section Four: Moving Forward - Watershed Restoration Priorities**, addresses future restoration priorities and objectives.
SECTION I: OVERVIEW

Implementation and Oversight Structure

The Malibu Creek Watershed Advisory Board, now called the Executive Advisory Council, was established in the early 1990s to address watershed pollution and restoration issues. Members of the Council include representatives of several local and state agencies, five municipalities, various other organizations and stakeholders, and the public at large (see Table 1.1). Throughout its tenure, the role of this Council has been to oversee, instigate and implement both upper and lower watershed restoration activities. More specifically, the group’s role has been to:

- Call attention to watershed service opportunities (including grants, studies, pilot demonstration projects, partnerships, events, etc.);
- Promote/implement watershed protection and restoration projects;
- Help secure funding opportunities such as Proposition A bond funds and US EPA/State 205(j) grants and 319(h); and
- Oversee subcommittee activities (subcommittees identified below);
- Serve as an information sharing and clearinghouse outlet.

The committee is also a Watershed Implementation Committee that advises the Bay Watershed Council on matters pertinent to this watershed.

To better focus on key watershed issues and to help carry out the mission of the Executive Advisory Council, eight subcommittees have been formed. These subcommittees report back to the Council about their activities/progress during the Council’s regularly scheduled bi-monthly meetings.

1. Volunteer Water Quality Monitoring Task Force

The role of this subcommittee is to encourage volunteers to become involved in water quality and habitat monitoring activities. They meet every other month to discuss the latest methods and techniques for providing high quality, reliable data that can be used by stakeholders and decision-makers. The task

* Active members, those organizations with consistent representation at stakeholder meetings, are bolded.

2 US Environmental Protection Agency (EPA)/State grants are provided for water quality planning and implementation activities, respectively.
force has developed a volunteer monitoring program called “The Stream Team,” which is now coordinated by Heal the Bay (a local environmental organization), to assess the health of and impacts to stream reaches throughout the watershed. Currently, three volunteer groups are monitoring over 16 fixed locations throughout the watershed.

2. **Steelhead Recovery Task Force**
   Originally called the “Rindge Dam” subcommittee, this group’s focus has shifted from simply addressing the feasibility of removing Rindge Dam to now looking at all potential/existing barriers impeding steelhead migration to the upper reaches of Malibu, Topanga, Solstice and Arroyo Sequit creeks and their tributary streams.

3. **Human Health**
   The role of this sub-committee is to identify and reduce health risks in the watershed, specifically those associated with recreational use of the creek, lagoon and surfzone. Most recently, they helped design a portion of the Coastal Conservancy/UCLA study\(^3\) which addressed pathogens.

   [This committee’s membership overlaps with the Monitoring and Modeling and Lower Malibu Creek and Lagoon Task Force subcommittees and its activities have been scaled down somewhat as a result.]

4. **Monitoring and Modeling Sub-committee**
   The role of this subcommittee is to design, coordinate and oversee monitoring efforts in the watershed. In April 1999, the subcommittee released the draft *Malibu Creek Watershed Monitoring Program* which has the primary objective of “collecting data and information on pollutants and other problems that impair the formally designated beneficial uses of Malibu Creek and its tributary streams.” The report was reviewed by the SMBRP’s Technical Advisory Committee and funds are now being sought to implement the plan.

5. **Lower Malibu Creek and Lagoon Task Force**
   The role of the Lower Malibu Creek and Lagoon Task Force has been to: 1) oversee lagoon monitoring and restoration efforts, 2) address the impacts of high water levels, breaching and septic system influences to the lower creek and lagoon and 3) serve as the review committee for the long-awaited Coastal Conservancy/UCLA study. Following the release of the report, the committee has started the process of selecting which creek/lagoon management options to pursue and implement.

---

6. **Invasive Species Task Force**

The Invasive Species Task Force was established in the later part of 1999 and its mission is to identify, assess and initiate removal of invasive plant and animal species in the watershed. Because many exotics are discovered through the efforts of other task forces, members of this task force work closely with them. The group has prioritized two actions: 1) to consult with the Los Angeles County Agriculture Commissioner about making Los Angeles County a “weed management zone” to become eligible for funding, and 2) to contact the Los Angeles County Department of Public Works about eliminating weeds in soil stockpile areas.

7. **Flow Reduction Task Force**

The Flow Reduction Task Force was formed during the Winter 1999/00. Initial meetings have addressed developing a mission statement and set of goals. The focus of the task force will be on reducing stream flows into impacted streams within the watershed and on reducing residential/community demands for imported water through conservation.

8. **Education Task Force**

This Task Force was formed in January 2000. At their first scheduled meeting, members began development of a mission statement, goals and a future plan of action. The primary focus of the Task Force will be on educating local residents and stakeholders about the restoration and preservation activities occurring in the Malibu Creek Watershed.

### Watershed Impairments and Problematic Issues

The 1994 Water Quality Control Plan (i.e., the Basin Plan) developed by the Los Angeles Regional Water Quality Control Board (LARWQCB or Regional Board) identifies the entire Malibu coastline and Malibu Canyon and Lagoon as “Significant Ecological Areas” (SEAs), and documents 19 existing, intermittent and potential “Beneficial Uses” within the Malibu Creek watershed. However, various causes of impairments (Table 1.2) to this watershed threaten both its SEAs and beneficial uses. Some of the causes are well documented in several publications, including: 1) the Soil Conservation Service’s *1995 Malibu Creek Watershed Natural Resources Plan*, 2) the Regional Board’s *1997 Santa Monica Bay: State of the Watershed* report and *1994 Water Quality Control Plan*, and 3) the Coastal Conservancy’s *1999 Lower Malibu Creek and Barrier Lagoon System Resource Enhancement and Management* report.

Watershed impairments, such as urban runoff, excess nutrients,
pathogens and bacteria, sedimentation and erosion, invasive species, and excess freshwater flows adversely affect habitats, endangered species and human health. A quick summary of these impairments and the issues associated with them are provided here.

**Urbanization and Development**

As mentioned in the introduction, Malibu Creek watershed’s population is growing at a significant rate (as much as 2 percent/year). This rapid growth is concurrent with development activities which contribute pollutant loads (heavy metals, nutrients, bacteria, trash and other inorganic compounds) through contaminated urban runoff, household waste, animal waste, on-site sewage disposal system discharges, illegal dumping and pesticide use. It also leads to greater demand for imported water, resulting in increased subsurface and creek flows and elevated groundwater tables, and ultimately impacting Malibu Lagoon and surfzone.

**Sedimentation and Erosion**

Much of the Malibu Creek watershed’s soils are considered highly erodible. Increased dry weather flows, unstable streambanks, fires, construction sites not properly maintained and poorly-graded hillsides all contribute to the watershed’s existing sedimentation and erosion problems. Brush clearing practices and roadside maintenance activities where dirt and debris are left on the side of the road and/or up-slope of creeks also increase sediment loads to receiving waters. These sources eventually reach the lower creek and lagoon and can adversely impact species and spawning grounds sensitive to high turbidity. Sediments also transport particle-binding pollutants, which in turn can affect many of the watersheds habitats and organisms. During seasonal high flow conditions (primarily during the rainy season), the impacts of sedimentation and erosion are especially pronounced.

**Invasive Species**

Both non-native plant and animal species in the Malibu Creek watershed have the potential to severely disrupt the natural ecosystem. The presence of non-native species can also be indicators of poor ecosystem health and represent competition for natural resources with native species.

The most significant non-native plant species include the giant reed, castor bean and wild tree tobacco (see Table 2.4 on page 67 for a more complete list of exotic plant species). The most significant non-native aquatic species include the western mosquito fish, yellowfin goby, oriental shrimp and polychaete worms.\(^4\) Bullfrogs, crayfish and large-mouthed bass are also problematic and can be detrimental to southwestern pond turtles, California newts (both considered

special species of concern in California) and Arroyo Chub.

**Nutrients**

Nutrient entering Malibu Creek watershed’s lakes, creeks and streams stem from a variety of point and nonpoint sources including animal waste, surface and groundwater flows, storm drain discharges, septic systems and Tapia Treatment Plant discharges. An overabundance of nutrients from these sources contributes to eutrophication problems in the watershed. Although evidence of eutrophication, specifically low dissolved oxygen and algal mats, is observed in some areas of Malibu Lagoon (Ambrose, et.al., 1999), the Las Virgenes Municipal Water District’s (LVMWD or the District) monthly water quality data suggest a significant downward trend in the amount of nutrients present in the watershed’s creeks and streams over the past ten years. Although little data has been collected on the watershed’s upstream lakes and some reaches of Medea Creek, they also show signs nuisance algae and have been listed on the Regional Board’s list of impaired waterbodies.

**Pathogens and Bacteria**

The presence of pathogens and bacteria in the watershed’s creeks, lagoon and surfzone is a significant human health concern. These pollutants come from sources such as:

- Septic systems: Systems not properly maintained and leach fields without adequate filter materials and distance are potential contributors of bacteria and pathogens to groundwater, creeks and the lagoon and surfzone.

- The Tapia Water Reclamation Facility: This facility, jointly owned by the Las Virgenes Municipal Water District and Triunfo Sanitation District, is located adjacent to Malibu Creek approximately 4.5 miles upstream from Malibu Lagoon. This facility treats municipal wastewater primarily from the cities and unincorporated areas of the upper watershed. Tapia has a processing capacity of 16 million gallons per day (mgd), but currently operates at 9 mgd. The tertiary-treated wastewater generated from this facility is either recycled or discharged into the creek, depending on the time of year, demand and/or other circumstances. Concerns have been raised for many years about both the quality and quantity of Tapia’s effluent and its impact on the Malibu Creek, Lagoon and surfzone.

- Animal waste: Livestock manure and domestic pet waste not properly disposed of can mix with storm water and/or urban runoff and eventually find its way to the watershed’s waterbodies.

---

5 The total contribution of pathogens and nutrients from lower watershed septic systems to nearby receiving waters has not been conclusively determined. However, studies are in progress to assess the impacts, if any, septic have on Lower Malibu Creek and Lagoon.
Excess Flows
About 18,000 acre-feet of water is imported into the Malibu Creek watershed each year. Ultimately, this imported water contributes to higher groundwater tables, increased creek flows, more frequent lagoon breaching events and greater volumes of polluted urban runoff entering storm drains and local waterbodies.

Land Acquisition
Much of the undeveloped land (other than parklands) in the Malibu Creek watershed is privately owned and has the potential to be developed. Acquisition of such properties could increase existing wetlands, protect riparian corridors, preserve open space and provide for greater protection of the watershed’s sensitive species.

Shortfalls in Funding
Achieving long term restoration, protection and management goals depends, to a large extent, on the availability of funds to carry out these activities. While a significant amount of funding has been secured for watershed activities (Table 1.3, starting on Page 12), much more is needed to accomplish the goals outlined in the Malibu Creek Watershed Plan.

Inspections and Enforcement
Historically, inspections and enforcement activities have not been a priority among key agencies. However, there are a whole host of enforcement activities that, if aggressively conducted, could improve water quality in the watershed. Examples include: 1) routinely monitoring construction sites to ensure that pollution prevention BMPs are properly implemented; 2) periodically inspecting/monitoring septic systems to ensure that they function properly; 3) identifying and prohibiting illicit connections to the storm drain system; and 4) enforcing local ordinances. Enforcement agencies having local authority include the CA Department of Fish and Game, CA Regional Water Quality Control Board, Los Angeles County Department of Health Services and all watershed municipalities.

Effects on Human Health and Habitats

Human Health Impacts
Pathogens and viruses from septic systems, animal waste and polluted runoff all contribute to exceedances of water quality standards and affect the health of swimmers and surfers in Malibu Lagoon and the adjacent surfzone. This area consistently receive bad grades due poor water quality, and signs are posted much of the year warning swimmers about the health risks associated with recreating in these polluted waters.

Habitat Impacts
The pollutants and other causes of impairments listed above impact the Malibu Creek watershed’s habitats and resources in a variety of ways. Non-native plant species displace and/or out-compete native species. Imported water demands disrupt the natural ecosystem, ultimately causing high lagoon water levels and contributing to unnatural lagoon breaches (although the long-term effect of this is not fully known⁶). Construction barriers impede native aquatic species abilities to reach upstream habitats and spawning grounds. And, increased pollutant loadings degrade water quality by lowering dissolved oxygen levels, contaminating sediments with heavy metals and other toxins, and increasing turbidity and nuisance algae.

**Watershed Studies and Projects**

Table 1.3, starting on page 12, highlights key projects, stakeholder groups and partnerships (e.g., the Executive Advisory Council and its sub-committees) who have been instrumental in applying for and securing grant funds for restoration activities throughout the watershed. Specifically, the table highlights 17 Malibu Creek watershed projects that have been successfully implemented, conducted or started over the past eight years. It also showcases: 1) the partnerships vital to successful implementation of restoration activities, 2) the funds that were leveraged or secured ($4+ million), and 3) the variety and types of projects undertaken in both the upper and lower watershed. For example: alternative wastewater discharge options have been studied; streambanks and other sensitive habitats have been restored and/or constructed; endangered species have been reintroduced; pathogen sources have been evaluated; livestock BMPs have been developed/promoted; and water conservation is being addressed.

Additionally, **Section Four: Moving Forward with Restoration Priorities** identifies the **Top 10 Restoration Priorities in the Watershed** as well as a complete list of recommended projects that are considered high priorities for implementation, but in which little or no progress has been made to date. While some actions lack the necessary funds and/or data to be successfully carried out, others are just now becoming priorities in the watershed. In the coming years, they will no doubt become the focus of the Executive Advisory Council’s restoration and preservation efforts.

---

⁶ Two independent studies conducted six years apart actually show a slight increase in the biodiversity in Malibu Lagoon despite several dozen intervening breaching events. These studies include 1) *Malibu Lagoon: A Baseline Ecological Survey*. Resource Conservation District of the Santa Monica Mountains, 1989 and 2) *Enhanced Environmental Monitoring Program at Malibu Lagoon and Malibu Creek*, UCLA, 1995.

### Framework for Monitoring Enhancement and Action for the Malibu Creek Watershed

**Timeline:** January – June, 1998

**Lead:** Heal the Bay, CA State Coastal Conservancy and the Graduate Dept. of Landscape Architecture (CSU Pomona)

**Summary:** Watershed assessment and design of a citizen volunteer monitoring program (Stream Team) that collects useable high-quality data that addresses specific issues in the Malibu Creek Watershed and fills data gaps for regional stakeholders. A 150-page easy-to-understand, step-by-step field guide was produced and is used by volunteers to conduct water chemistry and stream walk monitoring activities. The guide also contains educational information about natural processes, issues of concern and the history of urban development in the Malibu Creek watershed.

| CSCC         | $37,000 |

### 3 Endangered Species Protection Studies (Steelhead Trout)

**Timeline:** See summaries

**Lead:** LVMWD

1) **Summary:** April 1998 – June 1999. Recording of temperature data at multiple stations in Malibu Creek for a period of one year and compilation of steelhead trout temperature requirements. The final report (which was submitted to the LARWQCB) found that temperature ranges, while slightly higher than optimal below Rindge Dam, are sufficient to support all states of steelhead trout.

2) **Summary:** December, 1997. Compilation of data on the steelhead in Malibu Creek, including original research on steelhead genetics and the recommending of listing steelhead trout as a unique and endangered population.

3) **Summary:** November, 1998. Water audit of riparian vegetation in Malibu Creek to determine the minimum flows necessary to sustain steelhead trout while minimizing inflows to the lagoon.

EPA 319(h) – Environmental Protection Agency Nonpoint Source Implementation grant program
EPA 205(j) - Water Quality Planning grant program
Proposition A funds - Los Angeles County grant funds for storm water control capital projects
SECTION II: ACTION PLAN UPDATE

In order to implement Malibu Creek watershed restoration activities in a more comprehensive and focused manner, in 1994 forty-four action item goals were developed by consensus through a one-year series of facilitated meetings with watershed stakeholders; the process also included identifying implementors responsible for each of the 44 actions. Although no timelines were provided for these restoration activities, there has been and continues to be determination among watershed stakeholders to implement them as soon as technically feasible or financially possible.

This section of the Malibu Creek Watershed report provides complete status updates and assessments for implementation of the 44 actions. They have grouped by topic according to the Action Plan. (see Appendix One for a complete table of these actions).

**Overall Water Quality and Quantity Goals**

1. *Protect Beneficial Uses.* Develop and set water quality objectives to prevent point and nonpoint pollutant sources and pathogens from adversely affecting the beneficial uses of the watershed and nearshore environments.

The Los Angeles Regional Water Quality Control Board (LARWQCB or Regional Board) is responsible for establishing water quality standards for all Los Angeles and Ventura County waterbodies, including those in the Malibu Creek watershed. The updated *Water Quality Control Plan* (or Basin Plan), prepared by the LARWQCB in 1994, is the guidance document that includes the beneficial use designations within the watershed. Specifically, the Plan:

- Designates beneficial uses for surface and ground waters;
- Sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses of and conform to the state’s antidegradation policy;
- Describes implementation programs to protect all waters in the Region; and
- Incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality policies and regulations.

---

7 A complete summary of the mediation efforts that lead to the development of the Executive Advisory Council and the 44 Action Items can be found in the document, *Comprehensive Malibu Creek Watershed Mediation Effort, Final Report.* May, 1994.
The Basin Plan\(^8\) identifies 19 existing, potential and/or intermittent beneficial use categories for waterbodies in the Malibu Creek watershed (see the 1994 Basin Plan for a complete list). The Plan also sets specific watershed water quality objectives for total dissolved solids (TDS), sulfate, chloride, boron and nitrogen, in addition to general county-wide water quality objectives (ammonia, bacteria, coliform, biochemical oxygen demand (BOD), chemical constituents, chlorine, nitrogen, oil and grease, etc.). The mechanisms used to achieve these water quality objectives include:

- Issuing permits (NPDES, WDRs)\(^9\) with contaminant discharge limits to point source dischargers;
- Requiring cities to prevent/control polluted discharges through implementation of comprehensive urban runoff control programs and best management practices (BMPs) as called for in the 1996 Municipal Storm Water NPDES permit issued by the Los Angeles Regional Water Quality Control Board;
- Requiring cities to adopt local ordinances for the control of nonpoint sources of pollution within their jurisdictions;
- Adopting regional waste discharge requirements for residential septic systems;
- Conducting public education programs to prevent residential sources of pollution (this task is not carried out directly by the Regional Board but is required under the Municipal Storm Water permit).
- Enforcing the California Porter-Cologne Act and the Federal Clean Water Act by conducting routine inspections, issuing fines and/or “Cease and Desist” orders to offenders and requiring cleanup of contaminated sites.
- Initiation of Total Maximum Daily Loads (TMDLs) for pathogens and nutrients for Malibu Creek and Lagoon.

---

\(^8\) The Basin Plan’s legal authority is provided under the California Porter-Cologne Act.

\(^9\) National Pollutant Discharge Elimination System (NPDES), Waste Discharge Requirements (WDRs)
2. Protect Recreation. Ensure swimming, surfing and fishing without adverse health effects posed by poor water quality. Protect appropriate recreational opportunities such as surfing, swimming, sportfishing, sailing and hiking in the creek, lagoon and surf system as long as it doesn’t impact other beneficial uses.

This action is a goal rather than an actual action and its success is directly linked to the successful implementation of virtually every other action listed herein.

3. Protect Ecosystem/Endangered Species.

- Enhance and protect lagoon, creek, beach and intertidal habitats for threatened and endangered species, native biodiversity and riparian habitat.
- Attain and maintain water and sediments of sufficient quality to support a healthy creek, lagoon and surfzone, taking into account interactive impacts.
- Prevent any increased input of substances in toxic concentrations into the watershed and surfzone.
- Reduce habitat degradation caused by road/bridge building encroachments and dumping of road materials, and adopt ordinances and watershed-wide joint powers agreements to do so.

Many of the activities that must occur to accomplish the goals of this action are incorporated into the goals of other actions, in particular Eliminate or Reduce Sources (#4), Biological Standards (#5), Reduce Accelerated Sedimentation (#10), Temperature (#12), Restore/Enhance Malibu Lagoon and Surfzone (#20), Malibu Lagoon Bridge (#26), Runoff Reduction (#31), Habitat Protection (#33-38) and Coordinate on a Watershed Basis (#39).

Believed to have vanished from the area some time ago, the federally endangered red-legged frog was recently discovered on the Ahmanson Ranch development site in the northern portion of the Malibu Creek watershed. On that same property, a large patch of 40,000 San Fernando spine flowers was also discovered. Formerly, the flower was believed to be extinct since the 1920s. The fate of these two species is ultimately tied to how the development project proceeds, which, as of the date of this report, has not been determined.

4. Eliminate or Reduce Sources. Eliminate or reduce, by sub-watershed area, sources of harmful pathogens, toxic chemicals, sediments and nutrients.
Pathogens, toxic chemicals, sediments and nutrients are transported to local waterbodies through groundwater, storm water and urban runoff flows. To help minimize the impacts of these pollutants, the County of Los Angeles and its 85 cities are required under the 1996 Municipal Storm Water NPDES permit to control polluted runoff discharges within their jurisdictions. Since approval of this permit, all four Los Angeles County cities in the Malibu Creek Watershed have adopted local ordinances which clearly identify and prohibit activities specifically known to contribute pathogens, toxic chemicals, sedimentation and nutrients to local waterbodies. Such ordinances also give cities the legal authority to immediately enforce these prohibitions. Table 2.1 highlights the measures covered addressed in the local ordinances recently adopted by Malibu, Calabasas, Agoura Hills, Westlake Village and Thousand Oaks.

The County of Ventura and its Malibu Creek watershed communities have taken a similar approach those listed for Los Angeles County to eliminate sources of pollutants. These include: 1) adoption of local ordinances and the legal authority to enforce them; 2) implementation of public education programs; 3) inspections for all auto repair and food/restaurant facilities to ensure compliance; and 4) establishing guidelines for all new developments to incorporate permanent BMPs as part of their design. Calabasas has also installed a continuous

Because many of the storm water ordinance provisions were only recently adopted by these watershed cities, it will take several years

---

10 The Municipal Storm Water NPDES Permit was issued by the Regional Water Quality Control Board in July, 1996.
before the water quality testing data collected can show trends in pollution reduction. Clearly, a comprehensive monitoring program is key to determining whether these measures are working.

Watershed cities also conduct public education programs to reduce point and nonpoint sources of pollution, which are addressed in Public Education (#42). And lastly, watershed efforts to reduce pathogens and nutrients are specifically addressed in Reduce Pathogens (#7), Reduce Nutrients (#9) and Septic Systems (#23).

5. **Biological Standards.** Establish viable minimum habitat standards to support native species of locality.

A whole variety of fish, bird and plant species, some of which are state and/or federally listed as endangered or threatened, depend on healthy watershed resources for their survival. However, these species may have different or even competing needs to survive. For example, fluctuations in the lagoon’s water level and regular tidal flushing are needed for birds to be able to access the mud flats, a situation which is achieved by routine breaching of the lagoon’s sand berm. The tidewater goby, on the other hand, can be adversely affected by fluctuations in salinity resulting from a breach. Reconciling these needs makes establishing minimum habitat standards a difficult task.

The Coastal Conservancy/UCLA study, *Lower Malibu Creek and Barrier-Lagoon System Resource Enhancement and Management*, evaluated minimum habitat standards in the lower creek and lagoon to better establish biological water quality objectives for several indicator species. The final draft of this report provided information about the physical tolerances of target species for parameters such as temperature, ammonia, pH, dissolved oxygen, nitrate, nitrite, sulfide chlorine and chloride. Two significant conclusions were drawn from Coastal Conservancy/UCLA’s research: 1) different species, even desirable species, have quite different tolerances; and 2) while there is much water quality data available, there is little information available about the tolerances of most of the target species to the physical condition of concern.

Separately, the Las Virgenes Municipal Water District (LVMWD) 

---

conducted a water audit of riparian vegetation in Malibu Creek to determine the minimum flows necessary to sustain steelhead trout in the creek while at the same time minimizing inflows to the lagoon. It was determined that a minimum of 2-4 cubic feet per second (cfs) would be required at the County gauge station to sustain the steelhead below Rindge Dam. This information was submitted to the National Marine Fisheries Service (NMFS) in 1998 for review. Historical evidence of drought years and groundwater flows and their effect on steelhead will also be considered by NMFS in its final determination of the minimum flow necessary to support steelhead trout.

The County of Los Angeles, Department of Public Works (LAC-DPW) and several other storm water dischargers have organized a regional storm water monitoring coalition whose goal is to establish a monitoring research agenda. Issues being discussed and considered for future research include the use of biological indicators to assess the health of inland and coastal waters in Southern California, and the feasibility of developing bio-criteria. (The coalition only defines areas of future research that might be undertaken by interested parties but does not actually conduct research itself.)

6. **Monitor Pathogens.** Use appropriate testing techniques to determine the presence of pathogens and test for compliance with established standards. Pathogen testing should be implemented when and where bacteria counts are high.

Rather than testing directly for pathogens, local agencies routinely test for the presence of pathogens using bacterial indicators such as coliform. Their efforts are highlighted below. Testing for pathogens directly is difficult because there is no rapid method to reliably quantify their presence in water samples. However, direct pathogen testing using one of the methods available has occurred twice in Malibu Creek. These tests were conducted under two studies — the *Enhanced Environmental Monitoring Program at Malibu Lagoon and Malibu Creek* study conducted in 1993-94 by UCLA and the *Lower Malibu Creek and Barrier Lagoon System Resource Enhancement and Management* study conducted by the Coastal Conservancy and UCLA in 1998. It is foreseeable that pathogen testing will occur on a routine basis once methods to detect pathogens directly are improved.

---

12 The County gauge station records stream flow velocities and collects samples for a variety of constituents in Malibu Creek just below the Tapia outfall and Piuma Road.
• During rain events, LAC-DPW samples for bacteria in storm water runoff near Piuma Road (as required under the 1996 Storm Water NPDES permit). The samples collected show that the amount of bacteria present in wet-weather flows are three to four magnitudes greater than the amount present in dry-weather flows. Since the sampling sites are in areas where there is no public contact, notifications are not made to the public. The monitoring results are, however, reported to the Los Angeles Regional Water Quality Control Board annually and available for public review.

• Since bacteria and pathogens represent a human health concern, the Los Angeles County Department of Health Services (DHS) conducts monitoring activities in unincorporated areas of the County and for any city that does not have its own health department. Where high bacteria counts are observed, DHS takes additional samples to identify the source(s) and closes beaches impacted by the discharge. If a source is identified, then enforcement action is taken by DHS or referred to the appropriate agency with legal jurisdiction (e.g., storm drain entry).

• In 1998, the City of Malibu initiated a septic system tracer study (the “dye” study) adjacent to lower Malibu Creek to determine to what extent, if any, septic systems may contribute pathogens to local receiving waters. In conjunction with the LARWQCB, Malibu then conducted an extensive water quality monitoring program within the creek, lagoon and beach area during the later half of 1999 to identify where septic systems may contribute pathogens and/or nutrients to the lagoon and surfzone. A more detailed update on these activities is provided under Septic Systems (#23).

• The City of Calabasas, through its Volunteer Water Quality Monitoring program, started monthly monitoring for total and fecal coliform in 1999 at six sites in Las Virgenes Creek. Although not currently publicized, the City does submit the monitoring information to the Regional Board and plans to make it available on their city website in the near future.

• Both the City of Los Angeles and the Las Virgenes Municipal Water District have considerable data (from weekly monitoring) on bacteria levels in Malibu Creek and the adjacent surfzone. In addition, LVMWD has funded several special studies which use advanced testing methods to detect the presence of pathogens and has pursued research into new detection methods through their industry research.
contacts. The District’s efforts have resulted in initiation of new studies on available detection methods by the American Water Works Association Research Foundation and the Water Environment Federation.

• Since the Tapia plant began discharging its effluent into Malibu Creek, there have been concerns about its contribution to the presence of pathogens and viruses found in the lower creek and lagoon. LVMWD has monitored Tapia’s effluent for more than 15 years and has funded and/or co-funded four independent studies on the quality of its effluent. These studies concluded that there is no significant risk of illness directly associated with Tapia’s effluent.

• Several years ago, the SMBRP assisted the Los Angeles County Department of Public Works in testing a new sanitary survey tool to identify the presence of human fecal matter in storm water flows. The goal of the method was to determine whether there was evidence of human waste by extracting coprostanol from storm water runoff samples through a separation process. The expected advantages to this approach were that: 1) identification of human fecal matter could be conducted in the field rather than the lab, and 2) the results would be available in hours rather than days.

While preliminary lab tests supported the feasibility of this method, field testing proved more difficult. Results of the study showed that field samples did not correlate well to controlled lab samples. Additional drawbacks to this method are: 1) coprostanol testing is considered very expensive (as much as 10x more) when compared to standard bacterial testing, and 2) there is little understanding of the role or impact of other storm water pollutants on the coprostanol extraction process. A significant amount of additional testing will have to be conducted and the cost of conducting field testing will have to decrease considerably before this particular sanitary survey tool will be considered for use in the field.

Although not occurring in this watershed, another sanitary survey method is undergoing preliminary testing in San Diego using DNA identification of human fecal matter to detect pathogen presence. This approach could potentially be considered for use in the Malibu Creek Watershed if results are encouraging.

---

13 Coprostanol is a type of sterol found in animal waste in unique ratios, depending on the animal (i.e., human ratios are distinct).
7. **Reduce Pathogens.** Reduce human pathogen inputs into the watershed.

Reducing pathogen loads is one of the premiere goals of the Malibu Creek Watershed Plan and it can be accomplished in two ways: 1) by preventing pathogens from reaching Malibu Creek and Lagoon by eliminating them at the source and/or 2) installing treatment controls (i.e., end-of-pipe solutions). Given the potential sources of pathogens (e.g., septic systems, tertiary-treated effluent, polluted urban runoff and illicit connections), they must all be addressed in a comprehensive manner to effectively reduce pathogen inputs into the watershed. To help further this action, the Regional Board will be looking at these sources and establishing a total maximum daily load (TMDL) for pathogens in the Malibu Creek Watershed by March, 2002 (see Watershed Assessment, #44).

Using Proposition A funds, the City of Malibu installed a Stormceptor facility with a disinfection device at the end of a 24-inch pipe that drains into Malibu Creek and Lagoon (commonly referred to as the Mystery Drain). Among other constituents, the system will reduce and/or remove pathogens from Mystery Drain discharges. The City is also considering treatment/disinfection devices for the remaining two storm drains discharging into Malibu Lagoon.

Additional efforts to control pathogen inputs from area septic systems are described in Septic Systems (#23). Also, Las Virgenes Municipal Water District’s efforts to find alternative uses and/or disposal options for Tapia’s effluent (rather than discharging it into Malibu Creek) are described under Water Imports and Discharge (#28).

8. **Study Nutrients.** Determine and establish achievable nutrient standards to maintain natural populations.

Several nutrient-based studies and data collection efforts have occurred throughout the watershed for many years, which include:

- Extensive sampling of nutrients was part of the Resource Conservation District of the Santa Monica Mountain’s (RCDSMM) *Effects of Breaching on the Biota* study. Water quality parameters such as Ammonia (as nitrogen), nitrates (as nitrogen), and phosphates were sampled in Malibu Lagoon from 1996-98. This data will soon
be compiled and available for use to the general public.

- The Las Virgenes Municipal Water District has collected nutrient and phosphate data for more than 20 years at 8-10 stations from the 101 Freeway to Malibu Lagoon. This data, which was also submitted to the LARWQCB suggests decreasing trends in both constituents over the past 20 years. (See Figure 2.)

- In 1979, Dr. David Chapman conducted a study on nutrients. Every month for a period of one year he surveyed algae throughout Malibu Creek and identified algal blooms to the lowest taxonomical level possible (typical species). Using the data collected, Dr. Chapman concluded that: 1) algal mats in Malibu Creek were dominated by Cladophora, distributed through the creek where flows were stagnant and shade was lacking, and 2) algal mats were scoured during winter storm events, thus creek algal biomass began afresh each year (i.e., there is no biomass carry over from year to year). His research suggests that the presence of nutrients alone does not govern the amount of or the extent to which algal blooms develop, but rather a collection of factors governs this. A study conducted by LVMWD in 1978 found that algal mats were prevalent in pools and stagnant waters without riparian canopy or shading throughout the watershed. This study supports Chapman’s conclusions.

- The Regional Board has established a TMDL unit to set discharge limits for pollutants throughout Los Angeles County. In the Malibu Creek watershed, they will be focusing specifically on nutrient loads, pathogens and coliform. The Regional Board expects to complete the TMDL process for these pollutants by March, 2002.

9. **Reduce Nutrients.** Reduce nutrient loads into the watershed. Reduce nutrient levels to natural background levels. Encourage the Tapia Treatment Plant to employ state-of-the-art technology to remove nutrients from their discharges.
Tapia’s discharges to Malibu Creek contain nitrate and phosphate levels which are higher than typical creek background levels (see Table 2.2). These levels have been identified as possible contributors to the algal blooms that cause lower dissolved oxygen levels in Malibu Creek, although various monitoring results show adequate dissolved oxygen (DO) levels in the creek below Tapia. The Las Virgenes Municipal Water District began voluntary biological nutrient reduction at its Tapia facility in 1992 by decreasing airflow to its aeration basins to reduce nitrate levels, and recently installed mixers to reduce nitrate levels even farther. Overall, the amount of nutrients discharged directly by Tapia has decreased about 35% since 1993.

Additionally, Tapia’s wastewater discharge permit, which was re-issued by the Regional Water Quality Control Board in 1997, requires significantly lower nitrate and phosphorus levels than the plant’s previous permit required. Specifically, it calls for nitrates to be reduced from 13 milligrams/liter (mg/l) to 10 mg/l and phosphorus from 6 mg/l to 3 mg/l. To meet these provisions, the Las Virgenes Municipal Water District is studying the effectiveness of percolation beds in removing nutrients from Tapia’s effluent. Prior to the permit provisions, however, LVMWD voluntarily implemented process changes at the Tapia facility to improve average nitrate and phosphorus removal efficiencies by 25-35%. As mentioned previously, the permit also prohibits Tapia from releasing its effluent into Malibu Creek from April 15th to November 15th, thereby significantly reducing the amount of nutrients discharged.

As part of its review on the nitrate and phosphorus limits established in Tapia’s current permit, the Regional Board is currently analyzing background nutrient levels in Malibu Creek subwatersheds and correlating their effects on biological factors (DO, temperature, pH, etc.). Based on results of the Regional Board’s assessment, Tapia may need to further reduce nitrate and phosphorus discharges associated with urban runoff.

The County of Ventura addresses nutrient problems through several programs, including public education targeting pet waste and residential use of fertilizers, education of municipal staff in charge of landscape maintenance, confined animal waste management and storm water discharge prohibitions.
Septic systems also discharge nutrients to the watershed. Septic leach fields which are not sufficiently separated from groundwater, and hydraulic gradients which “pull” septic discharges to local creeks can contribute to the nutrient loadings observed in Malibu Creek and Lagoon. Although the Regional Board is required to issue Waste Discharge Requirements (WDRs) to multi-family and commercial complexes using septic systems, their efforts have lagged in actually identifying and permitting these facilities (see Septics, #23).

Several other programs in the watershed promote nutrient reduction through education, implementation of appropriate BMPs and capital projects. Please see Confined Animals (#18), Septic Systems (#16), Composting, Recycling and Conservation (#29) and Public Education (#42) for related nutrient reduction activities.

10. **Reduce Accelerated Sedimentation.** Historical seasonal sediment flow to beaches should be allowed. Human-augmented sediment discharges into the watershed should be reduced by:

- Enforcing erosion control regulations on a subwatershed basis.
- Encouraging all cities and the County to adopt ordinances of no net increase in sediment from any development into the watershed.
- Adopting watershed-wide ordinances to reduce sediment runoff from private property.
- Minimizing the loss of topsoil in developing areas through implementation and enforcement of BMPs.
- Eliminating dumping of dirt on road shoulders.
- Eliminating massive grading within the watershed.

All construction activities/developments in Los Angeles County over five acres are required to obtain a Construction NPDES permit from the Regional Board by filing a Notice of Intent (NOI) and identifying appropriate/site-specific BMPs that will be implemented. The BMPs selected must be effective in prohibiting contaminated discharges from leaving a site under construction. The requirements will soon apply to construction and development projects greater than one acre.

Under the 1996 Municipal Storm Water NPDES permit, cities are required to adopt local ordinances which include sediment control/reduction strategies (see Table 2.1 under Eliminate Sources, #4 on 20). Sediment control/reduction strategies implemented within the watershed include the following:
• The City of Calabasas conducts annual reviews of erosion control plans for developers that have open construction sites (exposed soil, no stabilization), open City projects and any project starting during the rainy season. City inspectors also ensure that erosion control measures, which must be identified as a condition for receiving a development permit, are correctly installed and maintained (e.g., sandbags, berms).

• The Cities of Agoura Hills and Westlake Village require developers and new construction projects to implement wet weather control plans during the rainy season (October - April) and enforces them as warranted. State permitted construction sites (those 5 acres or greater) are checked at least once during each rainy season by City inspectors.

• The City of Thousand Oaks requires that: 1) all development projects (except single family residences) disturbing one acre of soil or more prepare a storm water pollution control plan (SWPCP) before receiving a grading permit, 2) new developments incorporate permanent BMPs into their site designs, and 3) erosion control plans be developed for all active projects before the start of the rainy season. Construction inspectors routinely check construction sites for proper implementation of SWPCPs and BMPs.

Additionally, in 1997 the RCDSMM (using Proposition A and US EPA 319(h) grant funds) implemented a sediment reduction and stream bank stabilization project along a 200-ft section of Las Virgenes creek adjacent to Lost Hills Road. Initially, the RCDSMM excavated approximately 17,000 cubic yards of old fill material which had been dumped in the streambed by a previous development project. A new mild streambank slope was then reconfigured using bio-engineering techniques (erosion blankets, geo-grid system, and native re-vegetation). The fill material removed from the site was accepted without charge by the County Sanitation District for cover at the Calabasas landfill. This in-kind contribution, estimated at $500,000 was the single biggest factor in allowing the project to proceed, as funds had not been secured to cover the disposal cost of the fill material. Since its completion in 1998, the restored streambank has successfully withstood several storms, become stabilized and is now considered fully restored. Based on the RCDSMM’s routine inspection of the stream bank, some components will be modified to increase its long-term stability.
11. **Fire Regulation-Erosion Control.** Modify fire regulation practices and weed abatement programs to reduce erosion. One method is to require mowing rather than discing of weed setback zones.

Since public safety is the primary objective in preventing wild fires, particularly in the Malibu Creek watershed, native habitats located near commercial establishments and residential homes have historically been removed or degraded. However, per the Los Angeles Fire code, the Fire Department has set in motion a progressive, preventative approach to fire safety while promoting native vegetation retention called the *Fuel Modification Program*. Implemented in 1996, this program requires landowners of any new construction or addition of 50% or more square footage to develop a fuel modification plan showing:

- Specific plant pallets
- Plant spacing and arrangement
- An irrigation plan
- Legal documentation of a comprehensive long-term vegetation maintenance program for the property.

Existing and future landowners are required to adhere to the plan’s components. Landowners are also required to comply with existing standards for brush clearance to reduce the threat of fire. The standards do, however, recognize the need for erosion control and watershed protection, and therefore allow up to three inches of grass to remain on relatively flat lands and up to 18 inches on slopes otherwise prone to significant erosion.

Cities in the watershed have also adopted policies promoting mowing rather than discing areas likely to erode and promote the use of drought-tolerant plants where possible.

12. **Temperature.** Establish water temperature policies for fisheries.

The RCDSMM has routinely sampled and accumulated lagoon water temperature data since 1989 as part of all of its Malibu Lagoon projects. Although this relatively long-term data has not yet been used to formulate water temperature policies (no lead agency identified), it is available for use upon request. The Las Virgenes Municipal water district also recorded temperature data continuously for one year at multiple stations in Malibu Creek and compiled temperature requirements for steelhead trout. The RCDSMM’s data, along with LVMWD’s data and the habitat/species information and assessments contained in the Coastal...
Conservancy/UCLA report, could help guide the development of a temperature policy for Malibu Creek and Lagoon.

13. **Storm Drains.** Employ appropriate BMPs for storm drains throughout the watershed. Stencil all catch basin inlets (storm drains).

In 1995 as part of its Gutter Patrol Program, Heal the Bay started stenciling catch basin inlets in the City of Malibu with the message “**NO DUMPING - This Drains to Ocean.**” Once the program was completed, they provided city personnel stencils and paint to ensure the longevity of this effort as stencils faded or as new storm drains were installed. Malibu’s local residents were also reached with the “No Dumping” message by Heal the Bay through educational door hangers (in the shape of fish), local community events and local newspapers. The same “No Dumping” stencils were provided to other cities in the Malibu Creek Watershed, thus promoting a consistent region-wide message discouraging illegal dumping of materials into storm drains. Storm drain stenciling is now required by all cities under 1996 Municipal Storm Water NPDES permit.

In May 1993, LAC-DPW developed a program to stencil a significant number of catch basins county-wide with the same phrase and logo “**NO DUMPING - This Drains to Ocean.**” Their initial effort included stenciling approximately 72,000 sites. The County then established a periodic re-stenciling schedule whereby three of the nine County areas would be re-stenciled each year (resulting in overall storm drain stenciling maintenance every three years). As part of this program, participating cities in the Malibu Creek watershed are scheduled to be re-stenciled sometime in 1999 (the County only provides stenciling service to those cities who contract with them for catch basin cleaning or who specifically request stenciling services). Cities who choose not to participate in the County’s program are required to conduct their own cleaning and stenciling programs and may or may not use the same logo and phrase. In the Malibu Creek watershed, Calabasas and Westlake Village contract with the County for these services. Agoura Hills cleans its own storm drains and removes debris annually prior to the start of the rainy season, but contracts with the County for stenciling of its catch basins. The City of Malibu conducts its own program entirely (as mentioned above).

These watershed cities also conduct regular street sweeping activities to help prevent storm drains from becoming clogged with trash and debris. The City of Calabasas, using Prop A funds, has even installed a state-of-
the art continuous deflection system (CDS) unit into one of its storm drains. CDS units use reverse-angle screens to filter out trash and debris once they enter the device. Initial research has shown these units to be quite successful at removing virtually all trash and debris from the system, and they are reportedly easy to maintain.

As mentioned under Reduce Pathogens (#7), three storm drains, which discharge flows directly into Malibu Lagoon were targeted for treatment by the City of Malibu. Starting in the winter of 2000/01, flows from one of the storm drains will be treated using an oxidan gas disinfection facility to eliminate bacteria and viruses before they reach the lagoon. If the results of this treatment process are successful, the remaining two drains will also receive the same treatment. The demonstration project is being sponsored with Prop A funds and by the City of Malibu, Southern California Edison and Purizer Corp, who is contributing the disinfection facility for the project.

14. Mobile Car Washes. Regulate mobile car washes to prevent discharges from reaching the creek and lagoon.

Under the 1996 Municipal Storm Water NPDES Permit, all four Los Angeles County watershed cities have adopted local ordinances prohibiting mobile car washes from discharging runoff to the municipal storm drain system. Enforcement of this provision is limited, and is conducted on an as-needed basis. See Enforcement – General (#40).

The County of Ventura and its watershed communities are not required under their Storm Water NPDES permit to regulate mobile car wash discharges. However, this concern is addressed somewhat through public education and outreach.

15. Illegal Drains. Eliminate known illegal storm drains entering the watershed.

The County of Los Angeles Department of Public Works prepared maps and connection inventory reports for 1082 storm drain segments county-side, resulting in discovery of 1838 undocumented connections. Of these, 49 illicit connections were found in the Malibu Creek watershed; 21 of them have since been formally documented and the other 28 are in the process of being documented. Typically, the County investigates all reports of illicit connections and advises the owners of these connections
to either document them or remove them.

Although no illicit discharges (including gray water and septic connections) have been identified to date, the City of Malibu relies on the legal authority provided under its storm water ordinance to eliminate them if and when they are discovered.

Heal the Bay, through its Malibu Creek Stream Team program, conducts extensive surveys along various creeks and streams throughout the watershed. Volunteers who walk segments of the creek document, among other things, discharge points or outfalls that lead directly to the creek/stream. This information can be compared to known discharge points and legal action can be taken when illegal discharge points are discovered.

16. **Septic Systems.** Implement dye study of the septic systems in the vicinity of the lagoon, creek and surfzone. Study all identified systems and replace all malfunctioning systems.

Please see summary under Septic Systems (#23).

17. **Trash/Park Sanitation.** Maintain sanitary conditions in parklands. Link to education in English and Spanish to prevent trash from impacting local resources. Manage and eliminate the harmful impacts of day use, including campers, picnickers and transients on water quality.

The California Department of Parks and Recreation (State Parks) has taken several measures to control the spread of trash and debris within its parkland boundaries, including: 1) installing gull/bird proof lids on trash cans, 2) utilizing bilingual employees to enhance educational efforts to Malibu Creek State Park day-use visitors, and 3) periodic removal of transient encampments. However, signs posted in the park are not in both Spanish and English, and their visibility is poor.

Heal the Bay records dump sites during its stream walk activities, which includes parklands. The information collected should be used in determining where to best place trash cans within State Parks boundaries.

18. **Confined Animals.** Develop BMPs for livestock waste management.
- Conduct a survey of existing locations and amounts of animal waste within the watershed.
- Prohibit dumping of horse manure along the creek. Enforce setbacks of horse corrals and horse manure storage.
- Set limits on the number of livestock per acre to protect resources from overuse by large domestic animals.

As one component of its EPA 319(h) Nonpoint Source Reduction grant, the RCDSMM conducted an extensive research effort to identify all horse owners and corrals in the Malibu Creek watershed. Their efforts culminated in the development of a Stable and Horse Management BMP manual to help reduce point and nonpoint source pollution from livestock waste. The manual provides information on how to manage horse waste, site planning and design for corrals, drainage and erosion control, etc. The project also included: 1) conducting a watershed-wide survey of horse owners to better understand their current management practices and needs; 2) designing and building a horse manure compost demonstration site as an educational tool for the public; and 3) producing a video entitled “Horse Management Program.” These materials are available to the public upon request. However, there is some concern that the message is still not reaching horse owners, or that the owners are not motivated to change their stable locations or practices. For example, Heal the Bay’s Stream Team has identified several horse facilities near streams and riparian zones that have poor or non-existent manure management measures. These facilities adversely impact the watershed’s creeks and streams.

The County of Los Angeles, Department of Health Services maintains a horse stable monitoring program through biannual inspection of stables with four or more horses throughout the County. These inspections verify that applicable best management practices related to storm water regulations are being implemented and that horse waste is well contained and prevented from reaching the storm drain system. When violations are discovered, the
Department of Health Services takes action to remedy the situation by first working with horse owners. Fines and restrictions are then imposed if that avenue is not effective.

This City of Malibu plans to conduct a survey of horse corrals within the city and will be providing education for proper management of manure once this activity is completed. Additionally, new and re-development projects within the city will be required to provide measures to assure that runoff from corrals does not reach the storm drain system.

19. **Household Irrigation Runoff.** Survey households in upper Medea Creek development to determine reasons and solutions for extraordinary water runoff and report to advisory committee.

   Dry-weather urban runoff from households in the watershed primarily comes from activities such as yard and garden watering, car washing and hosing down driveways and sidewalks. The Metropolitan Water District (MWD) and the Las Virgenes Municipal Water District both offer water conservation education classes for residents addressing such issues as when to water the lawn, what plants are more drought resistant, how to properly install irrigation systems, etc. There are also a host of educational efforts encouraging residents to minimize excessive water use both indoors and outdoors.

   However, no official study has been conducted nor report presented detailing reasons for and solutions to the volume of runoff coming from any residential community in the watershed.
Malibu Lagoon and Surfzone Only

20. **Restore/Enhance Malibu Lagoon and Surfzone.** Restore and/or enhance Malibu Lagoon, including threatened and endangered species.

Table 2.3. Threatened and endangered species found in the Malibu Creek watershed.

The 13-acre Malibu Lagoon and its surrounding coastal salt marsh, wetlands and surfzone are significant biological resources for both bird and aquatic species, some of which are threatened or endangered (see Table 2.3). The area also represents a vital resting and feeding “stop over” point for many migratory birds, which is especially important given Southern California’s few remaining viable habitats along the Pacific flyway.

The avian species listed in Table 2.3 are impacted by a variety of problems in Malibu Creek Lagoon, including: 1) persistently high lagoon water levels which submerge valuable mudflat habitat, 2) human and pet disturbance, 3) poor lagoon water quality, and 4) non-native vegetation. Restoration efforts to improve overall water quality in the lagoon, increase available habitat and limit intrusions have only recently begun. Initial efforts include: 1) the mudflat island created in the lagoon by the RCDSSMM through a State Parks grant in 1995, 2) data collection and assessment via several studies and long term projects [see Table 1.3 starting on page 12], and 3) the recent study conducted by the Coastal Conservancy and UCLA on Lower Malibu Creek and Lagoon biota, water quality, hydrology and sources/impacts.

Two primary endangered aquatic species found either currently or historically in the Malibu Creek and Lagoon include steelhead trout and the tidewater goby. The last account of steelhead trout in either Malibu Creek or Lagoon was in 1997, the same year that the species was added to the federal endangered species list. Loss of upstream habitat and spawning grounds are believed to have contributed to its decline and ultimate disappearance in Malibu Creek reaches. Under the guidance of the Santa Monica Mountains Steelhead Trout Recovery Task Force, restoration efforts are just getting underway for this species. The focus of the task force includes assessing the feasibility of removing of Rindge Dam and other creek barriers impeding steelhead migration to upper reaches of the creek.
The tidewater goby, which was added to the federally endangered species list in 1993, was extirpated in Malibu Lagoon in the late 1960’s/early 1970’s due to the incremental and cumulative effects of environmental stressors such as habitat reduction (resulting from development activities), channelization and destruction of spawning grounds. Prior to the listing, in 1991 restoration efforts had started to both reintroduce and sustain populations of the tidewater goby in Malibu Lagoon. With a grant from the California Department of Parks and Recreation, the Resource Conservation District of the Santa Monica Mountains and Heal the Bay re-introduced 52 tidewater gobies. Seven years later, RCDSMM fish surveyors recorded 1,632 tidewater gobies at four sampling stations in the lagoon. Although the species is nowhere near the point of recovery from a statewide perspective, this number represents a significant improvement for the tidewater goby in Malibu Lagoon. A full report documenting the project, which also includes substantial water quality analysis performed before, during and after the re-introduction, is available from the RCDSMM.

The RCDSMM conducted another lagoon restoration effort in partnership with State Parks and the California Department of Transportation (CalTrans) in 1995. Using EPA Near Coastal Waters Program grant funds, a significant portion of Malibu Lagoon was restored by excavating over 2,200 cubic yards of old fill material and creating additional aquatic, mud-flat and high storm flow refugia habitats for birds, tidewater gobies and other aquatic species. Post project monitoring of fishes, water quality, and invertebrates was also performed. This data is available from the RCDSMM.

Heal the Bay, through its Stream Team volunteer program, has helped to reduce the volume of trash in the lower creek and lagoon. Since 1998, they have removed over 6 tons of trash. Heal the Bay also serves as the Los Angeles area coordinator for Coastal Cleanup Day, which includes beach clean-up activities at Malibu Lagoon and Surfrider Beach.
State Parks conducts periodic cleanup activities in the lagoon and surfzone area to remove trash and other unwanted materials. Their efforts are helping to preserve the initial restoration efforts conducted by the RCDSMM and others.

Future restoration and enhancement activities are being evaluated by the Lower Malibu Creek and Lagoon Task Force using the Coastal Conservancy/UCLA report recommendations (see Assess Sources/Characteristics, #21, below). A group facilitator is currently helping the task force establish selection criteria and guidelines for voting on the management alternatives outlined in the UCLA report.

---

21. **Assess Sources/Characteristics.**

- **Conduct a thorough and definitive study of lagoon water quality, identify all pollution sources, and develop a remediation plan strategy.**
- **Develop a comprehensive picture of the hydrology, circulation, biota of the lower creek and lagoon and surfzone for policy decision making.**
- **Perform quarterly toxic chemical tests in Malibu Lagoon and surfzone.**

In 1997, the California State Coastal Conservancy contracted with UCLA to conduct the *Lower Malibu Creek and Barrier-Lagoon System Resource Enhancement and Management Study*. The goal of this study was to provide the information and analyses needed for rational, scientifically-based decisions about the management and enhancement of Lower Malibu Creek and Lagoon. The three key objectives of the study were to: 1) compile and synthesize relevant existing information, 2) collect new information to fill critical data gaps, and 3) recommend management and enhancement strategies.

The draft report, which was completed in February 1999, provides information on the hydrology and morphodynamics, biological resources, water quality objectives, effects of eutrophication, management of pathogens and wetlands restoration alternatives for lower Malibu Creek and Lagoon. The report culminates with a list of management alternatives for policy makers to consider when undertaking or planning future restoration efforts. Comments on the draft report were submitted by various watershed stakeholders in May/June, 1999 and have been incorporated into the final report. Already, the Executive Advisory Council and Lower Malibu Creek and Lagoon Task Force members are
using this and other data collected by the RCDSSM (see below) to proceed with developing a remediation strategy for the creek, lagoon and surfzone. As a preliminary step, a facilitator/mediator has been retained by the task force to promote consensus among stakeholders in selecting and implementing various management actions identified in the final report.

Additional data on Malibu Lagoon was collected by the RDCSMM over several years. They have more than ten years of water quality survey data available that includes information on: 1) fish species diversity, densities, seasonal and relative abundance; 2) bird species diversity, seasonal relative abundance and specific area usage; and 3) pre and post- sand barrier breaching abundance and usage (for fish and birds). Two reports in particular, *Malibu Lagoon: A Baseline Ecological Survey* (1989) and *The Tidewater Goby (Eucyclogobius newberryi), Reintroduction of a Geographically Isolated Fish Species into Malibu Lagoon* (1993), provide a significant amount of water quality and biotic elements data. The RCDSMM also initiated a two-year study in November, 1996 entitled *Effects of Breaching the Sand Barrier on the Biota at Malibu Lagoon*. As part of this study, fishes and birds were surveyed, lagoon water levels were recorded and extensive water quality data was collected for ammonia (as nitrogen), nitrates (as nitrogen), phosphates, dissolved oxygen, turbidity, water temperature, pH and salinity. Data collection was completed in 1998 and is available for review from the RCDSSM.

Other Malibu Creek/Lagoon biota and water quality data have been collected over the past few years, primarily through projects requiring and/or conducting monitoring programs. These include:

- Construction of the new Pacific Coast Highway bridge (CalTrans);
- RCDSSM’s *EPA Near Coastal Waters Grant*;
- *Enhanced Monitoring Program on Lower Malibu Creek and Lagoon*¹⁴;
- Installation of groundwater monitoring wells in Malibu Lagoon State Beach (City of Malibu/State Parks); and
- The RCDSSM’s ongoing Marine Sciences Environmental Education Programs at Malibu Lagoon.

Collectively, this relatively long-term data is useful in understanding the comprehensive picture of Malibu Lagoon’s dynamic water quality.

---

¹⁴ This study was conducted by Rich Ambrose, et.al. (UCLA) in 1995 and funded by the Las Virgenes Municipal Water District ($110,000).
changes as well as providing insight into the character of the lagoon’s biota.

22. **Illegal Drains.** Eliminate known illegal storm drains entering the lagoon and particularly investigate sources emptying into the unclaimed storm drain.

A number of drain pipes exist that discharge flow directly into Malibu Lagoon. The largest, a 24-inch pipe known as the Mystery Drain, carries runoff from the Malibu Road catch basins adjacent to Webb Way and from private catch basins in the Malibu Colony area (this drain is not considered “illegal” by the City of Malibu). As mentioned under Reduce Pathogens (#7), the City of Malibu was awarded Prop A funds to install a Storm-ceptor near the end of the Mystery Drain to remove grease, oil, trash and sediment. The City has a long-term goal of eliminating “Mystery Drain” flows to Malibu Lagoon by redirecting the discharge through a new ocean outlet at the western end of the Malibu Colony. However, due to the complexities of permitting a new ocean outlet and private property issues, this project has not yet been scheduled.

23. **Septic Systems.** Implement dye study of the septic systems in the vicinity of the lagoon and surfzone. Study all identified septic systems and replace all malfunctioning septic systems.

Septic systems in the lower watershed have long been suspected of contributing pathogens and nutrients to the Malibu Creek, lagoon and surfzone. However, identifying all sources and reducing pathogen/nutrient loading have proven to be among the most challenging issues facing watershed stakeholders.

There are an estimated 390 multi-family and commercial complexes using septic systems in the City of Malibu. Although these users are required to obtain discharge permits from the Regional Board, only 11 complexes had filed for and received discharge permits by 1999 to operate their septic systems. Single family residential septic systems, estimated at 3,800, are not required to apply for a discharge permit from the Regional Board.

Many of Malibu’s 4190 septic systems are suspected of contributing

Figure 3. Septic system flow diagram.

pathogens and nutrients to the poor water quality conditions documented in Malibu Creek and Lagoon\textsuperscript{16}. They are suspected contributors because septic effluent is released through subsurface discharge pipes into leach fields near the creek, lagoon and surfzone (see Figure 3). This effluent contains pathogens and nutrients which, under the right conditions, can be mobilized in groundwater. The City of Malibu and other enforcement agencies have historically lacked sufficient data to assess whether septic systems actually contribute pathogens and nutrients to nearby receiving waters, and monitoring of homeowner septic maintenance and/or replacement activities has not been conducted.

Several studies over the past few years have been carried out to determine the sources and amounts of pathogens/nutrients contributing to the lagoon and surfzone’s degraded water quality. One such study, conducted by the Coastal Conservancy/UCLA, was completed in March 1999. While the report does suggest that nearby septic systems provide nutrients and pathogens to the lower Malibu Creek and Lagoon, how much is not clear. It recommends that more testing be conducted. (The study also included five different sampling events over a nine-month period to identify the presence of specific viruses in the lagoon and surfzone, but none were detected.)

Using consultants, the City of Malibu recently completed an extensive, two-phase study addressing the impacts of septic systems on Malibu Creek, lagoon and surfzone. In 1998 under Phase I, 11 groundwater monitoring wells were installed in strategic locations throughout the study area\textsuperscript{17} to evaluate the potential of pathogens to be transported from septic effluent to groundwater and ultimately the creek, lagoon and surfzone. Biophage\textsuperscript{18} tracers were used to determine this link. The results of the

\textsuperscript{16} Septic discharges occur underground in a leach field. The potential mobility of contaminants found the leach field are influenced by groundwater level and hydraulic gradient (direction and flow velocity).

\textsuperscript{17} Two wells were installed between residential septic leach fields and the lagoon, one in the Malibu Lagoon parking lot, seven in the vicinity of the commercial leach field nearest to Malibu Creek and one on Cross Creek Road up-gradient from the other test sites.

\textsuperscript{18} A biophage is a genetically synthesized virus that is physically identical to an enteric virus but is non-pathogenic.
first phase indicated two findings:

- Under simulated breach conditions when the groundwater table was at least 2 feet below the leach field, the biophage tracer (PRD-1) did not appear in any samples taken from the monitoring wells. However, bromide (another tracer) did appear in groundwater samples directly below the septic leach field, indicating that there is a hydraulic connection.

- Groundwater that first intersected the leach field and then was subsequently drawn down (simulating breach conditions) showed that both the biophage (MS-2) and bromide were transported beyond the leach field boundary.

Based on these findings, two conclusions were drawn. First, if at least two feet of unsaturated soil can be maintained between the bottom of a leach field and the top of the groundwater table, then there is little concern regarding pathogen transport. However, if the groundwater intersects the bottom of the leach field, then there is cause for concern that pathogens will be transported in the direction of the creek, lagoon and surfzone.

In 1999, a follow-up study (Phase II) was conducted by Malibu in partnership with the Los Angeles Regional Water Quality Control Board to identify potential sources of pathogens in the study area. The City and Regional Board participated in both the design of the study parameters and sampling events. Groundwater, surface water, sediments and storm drain discharge samples were collected and analyzed for coliform (total, fecal, e-coli, enterococcus), BOD, MBAS (a marker for detergent), nitrogen compounds (NO$_3$, NO$_2$, organic N) and phosphates. The samples were collected under different hydraulic conditions – during lagoon closure, breaching and open tidal action. Results of the study have been compiled and are available in the report, *Study of Water Quality in the Malibu Area, City of Malibu, California, Phase II*. Major findings of this report include:

- The discharges from three storm drains into Malibu Lagoon are contaminated with coliform bacteria, but the majority of coliform bacteria (99%) comes from Malibu Creek’s upstream sources.
- The height of the groundwater table is influenced by the state of the

---

lagoon (breached vs. bermed). Following a lagoon breach, concentrations of bacteria and nutrients found in the corresponding leach field area mobilize in the groundwater but attenuate over distance traveled.

- Samples taken from the wells located between the Colony and Malibu Lagoon suggest possible impacts from septic systems.

Also based on the monitoring results of the Phase II study, the Regional Board concluded in an August, 2000 report\(^\text{20}\) that:

- Septic systems contribute to groundwater pollution in the Malibu Valley due primarily to insufficient separation between the groundwater table and septic leach fields.
- There is a hydraulic connection between groundwater in the Malibu Valley and local surface waters as evidenced by the correlation between groundwater movement and Malibu Creek and Lagoon water levels.
- The nutrients and pathogens/bacteria discharged by Malibu Valley septic systems adversely impact Surfrider Beach.

There is disagreement over some of the conclusions drawn from the Phase I and II studies. Local regulatory agencies feel that additional factors must be considered before making any determination about the impact of septic effluent on Malibu Creek, lagoon and surfzone. Specifically, the geology of the site, direction of groundwater flow, time of day monitoring is conducted and the volume of effluent treated through the system must all be considered. At the time the *Making Progress: Restoration of the Malibu Creek Watershed* report was released, the project design, data collected and all conclusions drawn from the Phase II study had not been peer reviewed or evaluated by outside sources.

Although Malibu has not established an exact count of all private sewage disposal systems (PSDS) within its jurisdiction, the City has begun implementing programs, ordinances and other measures to assure the safe operation of on-site wastewater treatment systems. In 1999, the City adopted modifications to the Plumbing Code addressing or calling for

---

minimum tank sizes, appropriate flow rates, secondary treatment, filtering systems and more restrictive design criteria for new commercial and multifamily developments. The City has also seen problem septic systems in Malibu remedied through the use of advanced treatment systems. And, while no specific program requirements have been set, Malibu is also considering several strategies to further monitor and control septic system discharges. These include:

- Establishing a *Pumping Records Registration Program*;
- Developing an ordinance which would require mandatory retrofit to ultra low flow and low consumption fixtures/plumbing devices in all occupancy structures;
- Developing an ordinance requiring mandatory installation of grey water systems for all new construction;
- Adopting a contractor/plumber designed registration program; and
- Establishing an on-site, septic system inspection program.

In January 2000, the Santa Monica Bay Restoration Project convened a *Septics Management Task Force*\(^1\) to develop a set of recommendations for how to better manage this potential nonpoint source of pollution. These recommendations, which include local permitting and inspection/monitoring of single family septic systems, were presented to various agencies and stakeholders during the fall of 2000 and will be adopted in the beginning of 2001 by the SMBRP’s Bay Watershed Council. Once adopted, it will be the responsibility of the appropriate agencies to begin implementation of these measures.

The Ventura Regional Sanitation District, utilizing US EPA 319(h) grant funds, is planning a demonstration of off-the-shelf advanced individual disposal systems capable of treating household wastewater to less than 10 mg/l of total nitrogen. The results of this demonstration will certainly be useful to planners, agencies and septic system users in the Malibu Creek Watershed.

---

24. **Lagoon/Water Level Breaching.** Evaluate options for regulating lagoon levels without artificial breaching of the lagoon. Prevent unnatural breaching of the creek/ lagoon.

---

\(^1\) Participating agencies include the SMBRP, Heal the Bay, Supervisor Zev Yaroslavsky’s office, City of Malibu, State Department of Health Services, Los Angeles Regional Water Quality Control Board, City of Los Angeles, and Los Angeles County Departments of Health Services, Regional Planning and Public Works.
Until 1997, State Parks was informally permitted the authority to institute breaching activities when Malibu Lagoon’s waters reached a certain level. However, at the urging of local resource agencies who were concerned about the impacts of artificial breaches on the lagoon’s sensitive aquatic species (i.e., tidewater gobies), the California Coastal Commission (CCC) and Army Corp of Engineers halted all breaching activities until a study could be conducted to assess the overall impact to the system. Exceptions were granted only when public health was threatened, (e.g., when lagoon waters reached levels that caused malfunctions/backups of nearby residential and commercial septic systems).

The RCDSMM conducted a study, *Effects of Breaching on the Biota*, which looked at how breaching affects many species found in the lagoon. They concluded that there is definitely a negative impact on these species when breaches occur.

There are, however, periodic artificial breaches spearheaded by the “shovel brigade,” i.e., persons who feel that high water levels combined with poor lagoon water quality directly impact human health at a popular surf area. The shovel brigade takes it upon themselves to “control” where the breach occurs when the lagoon’s water level is so high that a natural breach is imminent. This group digs a channel at the western-most edge of the lagoon to prevent the sand that is washed out from piling up at the first break point and adversely altering the shape of the waves for surfing.

In August 1999, State Parks issued a *Request for Proposals* for the design and construction of a system that will help manage the lagoon’s water level during the dry season without adversely affecting fish and wildlife (e.g., tidewater gobies, steelhead trout). Until a system is approved and constructed, artificial breaching will not be permitted unless public health and safety are threatened.
25. **Public Notices.**

- **Breaching/Public Health:** Regular notices to inform the public and agencies about breaching times of lagoons.

  As a standard practice, State Parks informs the public and other concerned parties each time a mechanical/artificial breach of the lagoon is to be performed. In addition to notifying key agencies such as the Coastal Commission, State Parks notifies local newspapers. The Los Angeles County Department of Health Services and LA County Lifeguards posts beach closure signs and warn beach-goers near the breach point.

- **Encourage Los Angeles newspapers to publish weekly monitoring bacteria results at beach entrances.**

  In 1990, Heal the Bay launched the first-ever *Beach Report Card.* Using water quality data from samples collected by the Los Angeles County Department of Health Services, County Sanitation District of Los Angeles County (CSDLAC) and the City of Los Angeles Environmental Monitoring Division at Hyperion, Heal the Bay interpreted bacteria results and established a grading/reporting system (A-F) that the general public could easily understand. Initially, beach grades were published on a monthly basis for 61 beaches throughout Los Angeles. Grades are now provided for over 250 beaches in Los Angeles, Orange, Ventura and Santa Barbara Counties via local newspapers, marine shops surf and dive shops and on local weather stations. Grades are also posted on Heal the Bay’s website, which has undergone improvements to better inform the public about how the beaches are monitored and the health risks associated with swimming in the Bay.

  Four of the 250 beaches graded are located in Malibu – 3 locations near Surfrider Beach and one at Malibu Pier. Whenever the lagoon is breached, Surfrider Beach receives an “F” grade (based on water quality data). However, the data showed excellent water quality during the four summer months of 1999 when the lagoon was not breached.

- **Implement public notification and education programs about potential health problems at beaches.**

  In 1995, the Santa Monica Bay Restoration Project conducted a comprehensive epidemiological study to assess the correlation between contaminated storm drain discharges and incidence of swimmer illness.

---

22 Other organizations and agencies providing funding and support for this study include the
Results of this study showed, conclusively, that there is a significant increase in occurrence of illnesses among swimmers who swim within 100 feet of flowing, dry-weather storm drains. Immediately following the release of this study, new warning signs were created and permanently posted directly in front of flowing storm drains, calling attention to the dangers associated with swimming in urban-runoff contaminated waters. The results of the study also triggered revisions to the County’s Beach Closure and Health Warning Protocol, which now requires posting the new warning signs and notifying the public of beach closures in a timely fashion and on a more regular basis. Four years later, the results of this study are still used as a guidance tool by the media, environmental organizations and others to inform the public of the risks associated with swimming in front of flowing storm drains.

Following the Epidemiological Study, Heal the Bay initiated, helped draft and advocated for passage of a bill that would require California’s popular beaches (i.e., more than 50,000 visitors annually) which receive storm drain discharges to: 1) conduct routine water quality monitoring for three bacterial indicators, and 2) inform the public when established bacterial thresholds have been exceeded by posting warning signs or closing the beach. The bill (AB411), which was passed in October 1997, also requires local health agencies to set up a hotline to inform the public of all beaches currently closed, posted or otherwise restricted. Heal the Bay also utilizes volunteer speakers through its Speaker’s Bureau program to help educate over 25,000 people every year about: 1) sources of sewage to the bay, 2) the potential health problems associated with swimming in contaminated waters, and 3) where and when to swim in Bay waters. The program targets schools, corporations and community groups.
26. *Malibu Lagoon/Bridge*. CalTrans should set up a mitigation fund to cover the costs of any impacts to Malibu Lagoon and the surfzone resulting from the reconstruction of Malibu's Pacific Coast Highway Bridge.

Within one year of completing the Pacific Coast Highway bridge across Malibu Creek and Lagoon, CalTrans provided State Parks approximately $110,000 for salt marsh restoration activities. State Parks used these funds to remove exotic plant species in the area just below the bridge and revegetated it using native plants. CalTrans also provided $98,830 to the Resource Conservation District of the Santa Monica Mountains over a five year period (1996-2000) for tidewater goby monitoring and restoration activities (including funds for the *Effects of Sand Breaching the Sand Barrier on Biota* study; see Lagoon/Water Level Breaching, #24).
Watershed Solid Wastes and Other Wastes

27. Landfill. Expand the understanding of the impact of the Calabasas landfill on water quality and especially ensure that Calabasas landfill installs monitoring wells which they were directed to construct in 1990; report monitoring results of findings to the advisory committee.

In cooperation with the County Sanitation Districts of Los Angeles County (CSDLAC), the National Park Service (NPS) prepared an environmental assessment (EA) on the issuance of a special use permit for continued operation of the landfill. The EAs preferred alternative included issuance of a permit with 13 conditions to mitigate the impacts of the landfill on park resources and visitor enjoyment. These conditions include: 1) off-site preservation of 100 acres of habitat along the US 101 freeway corridor, 2) $40,000/year wildlife fund for wildlife habitat research, 3) native plant restoration of landfill slopes, 4) alternative grading concept plans, and 5) development of an interpretive wayside exhibit addressing solid waste management and environmental issues. The five year permit was issued in November, 1998 and implementation of its 13 conditions began immediately afterward.

As part of the condition of approving the permit, CSDLAC purchased off-site land to permanently mitigate the loss of habitat. The 107-acre parcel purchased (referred to as the Albert Abrams property) is located on the south side of Agoura Road, west of Liberty Canyon Road and is a vital link to the wildlife corridor.

A groundwater study is also being conducted at the landfill to further define the extent of the landfill’s effect on groundwater. In August and October 1999, eight piezometers were installed in the area to obtain geologic and hydrogeologic data. The information gathered will be used by the County Sanitation District to: 1) acquire those portions of the Lower Cheeseboro Canyon that contain surface or subsurface contamination and 2) design a water quality corrective action program. Routine post-rainfall surface water testing continues to show no adverse impact to surface water quality resulting from landfill operations.

28. Water Imports and Discharge. Maximize environmentally acceptable use of reclaimed wastewater (household and treatment plant) and grey water, and reduce the importation of potable water. Encourage use of reclaimed water for irrigation of landscaping and community open space. Price reclaimed water more competitively.
Harmoniously implement water conservation efforts and grey water ordinances between cities. Ultimate long-term goal of no-waste discharges into waters used for recreation and/or for sources of food.

The Las Virgenes Municipal Water District provides 65,000 residential customers, nearly 75% of the watershed’s residents, with approximately 18,000 acre-ft of imported water each year. Several other water agencies also supply an additional 10,000 acre-ft of potable water to upper watershed customers; these agencies include Callegus Municipal Water District, Triunfo Sanitation District, Oak Park Water Co., California Water Services Company, Lake Sherwood Community Services District and Hidden Valley Mutual Water Company. The amount of water returned by these residents to the Tapia facility for tertiary treatment is about 11,200 acre-ft, of which 5,000 acre-ft is recycled and beneficially used for irrigation. The greatest demand for Tapia’s recycled water is for irrigation purposes, usually from mid-June to mid-September, when temperatures are higher. Moderate, but highly variable demand is observed in the “shoulder” periods of May through mid-June and mid-September through October, with much lower demand for the remaining six months of the year. During peak demand, 100% of Tapia’s daily volume of recycled water is distributed to users and potable water is often used to supplement the supply. To keep spring and fall surplus water out of Malibu Creek, each year the District installs and then dismantles (to allow mowing and discing) over 35 miles of temporary irrigation pipes for surplus disposal via off-site spray fields. The District has even expanded recycled water incentives, giving surplus water away for free to its existing customers. It is also seeking state and federal co-funding to connect new customers that are currently too far away to serve economically. Combined, these programs/approaches have enabled the District to keep Tapia’s effluent out of the creek from mid-April through mid-November.

The Las Virgenes Municipal Water District has also passed ordinances requiring the use of recycled water anywhere state law allows and the distribution system can reach. Price incentives are used to encourage use of reclaimed water. The District also uses a tiered rate structure to discourage waste and runoff of potable water (i.e., the unit rate increases with excess use). Other water conservation efforts are highlighted under Composting, Recycling and Conservation (#29).

In November of 1997, the Regional Board renewed the Tapia Water Reclamation Facility’s NPDES permit and included new effluent discharge prohibitions. The new permit prohibits Tapia from discharging
its effluent into Malibu Creek from April 15th through November 15th. In 1998, during the first summer of prohibition, Tapia was unable to store or find alternative uses for its effluent and violated the permit several times during that period. Reasons for the violation include: 1) lower recycled water demands, and 2) the limited time period given for LVMWD to evaluate and implement creek discharge avoidance alternatives. However, LVMWD is seeking permanent alternatives to discharging into the creek. They hired consultants and engaged stakeholders to conduct a study which would identify and assess both short- and long-term options for using, storing and/or disposing of the effluent. The resulting report, entitled the Malibu Creek Discharge Avoidance Study, identified a whole range of discharge alternatives for LVMWD to consider. An Environmental Impact Report (EIR) was subsequently developed for four project alternatives and seven other potential project alternatives.\(^\text{23}\) The results of this report were provided to the Regional Board in late 1999.

At the municipal level, several cities have also taken measures to promote and/or require recycled water use. For example:

- Calabasas’ local city ordinance encourages use of reclaimed water for landscape irrigation purposes and planting of drought tolerant native species within its jurisdiction. The City’s Landscape Manager also provides technical assistance to residents who want information on efficient water usage by reviewing “plant palettes” for individual homeowners. Commercial development projects within the city require significant water budget calculations and plan checks prior to plan approval. A similar water budget program was instituted for individual homeowners originally, but because of the significant costs associated with developing a water allocation and budget plan, that program has been significantly reduced and is now limited to the elements mentioned above. The City’s Planning Department, in conjunction with the Environmental Commission, has developed an Environmental Connection Handbook which addresses many topics such as water conservation, native plants and xeriscape. This handbook is available to residents who request it.

- The Cities of Agoura and Westlake Village endorse water conservation and reuse, and utilizes reclaimed water in all city parks, along the freeway, on street medians and on parkways wherever

\(^{23}\) The four project alternatives included: 1) Deliver raw sewage to the City of Los Angeles sewer system; 2) Discharge recycled water to the Los Angeles river drainage basin; 3) Expand recycled water system; and 4) Store excess recycled water in the Las Virgenes Valley Basin.
available. Projects are routinely conditioned to utilize reclaimed water, such as landscaping projects along Kanan Road, Agoura Hills Road and along the 101 Freeway in these cities.

- The City of Malibu produced the *Grey Water Handbook* to help eliminate illegal disposal of grey water by encouraging residents to use it for irrigation. The city also modified the Plumbing Code to allow disposal through the use of sub-surface irrigation.

- The Triunfo Sanitation District endorses water conservation and promotes reclaimed wastewater reuse to its customers. These customers, which include the communities of Oak Park, North Ranch, Lake Sherwood and Westlake Village, use reclaimed wastewater on road medians and park grounds, and at schools and homeowners association developments. The City of Thousand Oaks and the County of Ventura also routinely condition projects to use recycled wastewater.

29. **Composting, Recycling, Conservation.** Implement improved recycling efforts. Maximize treatment and reuse potential of all aspects of the watershed's waste disposal operations (septic, sewer, sludge farming, and landfill operations).

- Encourage composting and other forms of recycling for waste management.
- Encourage recycling and reuse efforts to reuse water, household hazardous waste, plastics, paper, glass, cardboard, tin and aluminum.

Several different agencies, municipalities and organizations are both responsible for and committed to accomplishing the goals of this action. Together, these combined efforts aggressively promote recycling and conservation throughout the upper and lower watershed.

- LAC-DPW and Ventura County both conduct a variety of county-wide outreach programs on composting, recycling and conservation which target residents and businesses. Program components include:
  - Operating residential curbside recycling program for single and multiple family dwellings in most unincorporated areas. In addition to providing collection services, they provide educational brochures to residents to help increase their level of awareness about recycling issues.
  - Conducting Household Hazardous Waste Roundups in
partnership with cities throughout the County. In 1998, Agoura Hills, Malibu, Calabasas, Hidden Hills and Westlake Village participated in roundups that resulted in collection of 24,246 lbs. of waste.

- Producing and distributing of Public Service Announcements (PSAs) and educational advertisements/brochures.
- Hosting free workshops and events to educate residents about green waste recycling, composting and gardening techniques to reduce water use. This program also promotes the recycling of Christmas trees each year.
- Partnering with local agencies to provide household hazardous waste roundups for their residents on a regular basis.

LAC-DPW and Ventura County promote participation in recycling programs through radio PSAs, web sites, local newspapers, fliers, city hall offices, chambers of commerce and libraries. When roundups are scheduled in a particular city, a banner is often hung across a road in a prominent section of town advertising the event. Both Counties also offer semi-annual Green Gardening workshops for the general public which include non-toxic gardening suggestions and composting information/supplies.

- The Las Virgenes Municipal Water District promotes composting and conservation efforts through:
  - The Rancho Composting Facility, which recycles all of Tapia’s biosolids into garden compost. The compost is then sold in nurseries instead of being sent to the Calabasas landfill. The District has also installed two advanced energy fuel cells at the composting facility to convert methane gas generated from wastewater processing into electricity. The cells are now fully operational and generate power for use and sale.
  - A pilot incentive program, which was launched during FY 1998/99 for customers willing to replace all of their toilets with ultra low flow toilets (ULFT). This program tripled the number of ULFT retrofits in one year from 300 to 900.
  - The District co-sponsored North American Residential End Use Study, which installed data loggers in 100 homes to gather detailed information on water use. The data is being used to set national standards on appliance efficiency and conservation program planning. The study confirmed that toilet flushing is the single largest indoor use and provided data on leak incidence. Other water conservation practices promoted by LVMWD are
addressed under Public Education: Conservation (#30).

• The City of Malibu, jointly with LAC-DPW, maintains a permanent used oil drop-off site at its City Hall. The City also hosts monthly “Household Hazardous Waste Roundups” for collection of water-based paint, batteries and oil/oil filters, and bi-annual roundups for other chemicals. Malibu promotes its recycling efforts through the City’s quarterly newsletter and distributes oil recycling containers and literature through a partnership with a local automotive retailer. Using these collection avenues, local residents recycled approximately 1143 gallons of used motor oil during the fiscal year 1997/98.

• Calabasas recently began offering curbside recycling for green waste and mixed recyclables to local residents. The City also provides: 1) the Environmental Connection Handbook which promotes reducing/reusing/recycling, composting and correct disposal of household hazardous waste, and 2) monthly used oil, paint, batteries, and antifreeze recycling opportunities.

• The City of Agoura Hills offers residents several opportunities to recycle their waste and conserve water. They: 1) conduct a curbside recycling program for paper, metals, and glass (initiated in 1991); 2) conduct a Christmas Tree recycling program each year; 3) initiated yard waste and household hazardous waste collection programs in 1995, and 4) adopted a Water Efficient Landscape/Irrigation ordinance in 1992 to reduce the amount of water being used for landscape/irrigation purposes. The City also began using rubberized asphalt in all overlay programs. During fiscal year 1998/99, the City used over 15,000 recycled tires in the overlay program.

• The City of Thousand Oaks offers weekly curbside pickup of green waste for recycling and bi-weekly pickup for paper, glass and metals.

• State Parks ensures, through its waste hauler contracts, that recycling bins are provided for the public to use when visiting Malibu Creek State Park and Malibu Lagoon State Beach.

30. Public Education - Conservation. Develop individual support for conservation practices through education, training and workshops which would reduce sediment and storm water runoff from private property.
Only the activities undertaken by the Las Virgenes Municipal Water District promoting water conservation are addressed here. Other implementor’s conservation programs are part of ongoing, wide-scale and multi-issue public education programs and are addressed under Public Education (#42).

The Las Virgenes Municipal Water District conducts a variety of water conservation programs and outreach projects throughout the year, which include:

- Bilingual “Protector del Aqua” classes emphasizing water conservation for local landscape maintenance companies.
- Distribution of educational fliers promoting water conservation to service area residents (in partnership with the Triunfo Sanitation District).
- A comprehensive website (www.lvmwd.dst.ca.us) with easy-to-find water conservation tips and information.
- Participation in local events, such as fairs and farmers markets.
- Classroom presentations and facility tours.
- Water efficiency tours to help residents reduce the amount of water needed for landscape irrigation.
Land Use

31. **Runoff Reduction.** Develop land use decision-making approaches (including land use zoning and ordinances) to reduce point and nonpoint sources of pollution. Specifically, new developments within the watershed should employ on-site reuse of reclaimed water so that there is no net increase of water into the watershed. Develop and implement: 1) guidelines for minimizing and mitigating ecological disturbances related to point and nonpoint water flows into “unimproved” coastal streams; and 2) watershed-wide ordinances which would reduce storm water runoff from private property.

In January 2000, the Los Angeles Regional Water Quality Control Board approved strict discharge standards for new developments in all of Los Angeles County. The Regional Board’s Executive Officer then issued the new requirements in March, 2000. Specifically, the policy states that all new development projects meeting certain criteria must retain and/or treat the first ¾-inch of rainfall from any storm on-site (i.e., it must not reach the storm drain system). The policy will have a greater impact on newly developing regions than on existing, high density regions. Several cities in the County have appealed this ruling to the State Water Resources Control Board.

The City of Calabasas requires that new developments maintain a certain percentage of pervious surface, depending on what type of construction project is designed. For example, parking lots are required to maintain 30% perviousness. However, in some areas of the City, soils are high in clay content and hence expansive so pervious requirements are challenging. Development projects are thus evaluated on a case-by-case basis. Mitigation measures are required for those sites that do not, or cannot incorporate the pervious surface element into their plans.

The Cities of Agoura Hills and Westlake Village adopted their storm water and urban pollution control ordinances in 1997. As mentioned under Eliminate or Reduce Sources (#4), this ordinance gives Agoura
Hills and Westlake Village legal authority to enforce BMP requirements to reduce point and nonpoint sources of pollution, including site-specific measures for construction projects to minimize ecological disturbances.

The City of Malibu primarily addresses the problem of increased urban runoff from new development through setting limits on impervious surfaces under its zoning ordinance. The criteria for commercial developments includes: 1) devoting 40% of the lot area to landscaping, 2) devoting an additional 25% of the lot area to open space, and 3) limiting the floor area ratio to 15%. The criteria for residential developments includes limiting the use of impermeable surfaces to 30-45% of the total site area. Where downstream flooding and/or erosion is a potential concern, the City also requires developments to provide on-site retention of runoff volumes equal to predevelopment rates.

Recently, the Las Virgenes Municipal Water District, with support from the Metropolitan Water District of Southern California and the US Bureau of Reclamation, installed computerized irrigation controllers on street medians to regulate the amount of water used for irrigation. These controllers were tested against other controllers in the City of Westlake Village. The District also installed advanced plant ETo sensors stations with real-time telemetry which measure the amount of water used by local plants each day. This daily data is linked to the LVMWD website (http://lvmwd.dst.ca.us) and can be accessed by all residents who use irrigation controllers for outdoor irrigation to refine their irrigation schedules. The ultimate goal in providing this data is to reduce: 1) the amount of water needed for irrigation by end users and 2) runoff from street medians. Nearly all large water users such as golf courses, schools, and cities could benefit significantly from the information provided by the ETo sensors. In the coming year, the District will begin to educate the top 20% of its largest users about the sensor data to help them understand its benefits, how to access the data and how to make corresponding changes in their irrigation practices.

32. **Recreational Use Impacts.** Reconcile demands for public access and resource protection regarding trails and roads.

There is a need to protect watershed habitats and resources while at the same time allowing these lands to be used for recreational purposes. To better balance these needs, the City of Calabasas outlined a comprehensive Las Virgenes Canyon subwatershed study in 1999 which included: 1) developing a master plan for Las Virgenes creek and 2)
outlining issues to be addressed, such as wildlife corridors, potential for recreation and public access, and engineering requirements for flood control. The information collected under this study will be used to develop a priority list of projects to accomplish riparian habitat improvements for both wildlife and residents. The City has submitted three major grant applications to secure enough funds to both initiate the study and to start working on some of the project’s components. The SWRCB 205(j) Watershed Planning Grant application received funding to initiate this study; the Federal EPA EMPACT Grant application was initially denied but resubmitted with changes; and the Water and Watersheds Research Grant application was denied.

In addition to installing interpretive signs next to the parking lot at Malibu Creek State Beach, the RCDSMM incorporated a public access trail into its Malibu Lagoon restoration project (highlighted under Restore/Enhance Malibu Lagoon and Surfzone, #20). Visitors can now walk directly to the shores of the lagoon near Pacific Coast Highway via a walk bridge and get an up close look at the lagoon’s mud flats, birds and aquatic habitat.

While State Parks provides public access to almost all of its natural resource areas, the agency does limit access in employee housing areas, areas that have been revegetated, nesting areas for sensitive/endangered species and any area considered unsafe.
Habitat Protection

33. Land Purchases. Purchase high priority watershed protection areas.

There are several key parcels of land that, if acquired by a non-profit organization or a state or local government agency, would greatly benefit overall restoration and protection goals throughout the watershed. Although none have yet been purchased, State Parks has identified several of these parcels in an internal report.

One such prominent site in the lower watershed is the golf course area adjacent to Malibu Lagoon (on the north side) and the vacant parcel next to it. This land was once part of the lagoon and has the potential to be restored as additional habitat for native species and birds migrating along the Pacific flyway. Other identified parcels include 160 privately owned, undeveloped acres located just north of the Cold Canyon Road northern loop; the Cross Creek Plaza; Ahmanson Ranch; and land near Lake Sherwood in the Hidden Valley area.

The National Park Service, in partnership with local scientists, planners and resource management professionals developed a set of objective, scientifically credible conservation criteria as a basis for deciding which lands in the Santa Monica Mountains were the highest priority for acquisition and protection. Using geographical information system (GIS) tools, lands high in resource value were identified, gaps in knowledge were identified, and maps identifying significant natural, cultural and recreational areas were produced. Land management agencies are using this data to set priorities for land protection within the Santa Monica Mountains and surrounding areas.

The City of Malibu is investigating the possibility of land acquisition for a constructed wetland in the Civic Center. If acquired, the land would provide for wetland treatment of Malibu Creek’s flows and a year-round source of water for the existing seasonal wetland located on the north side of the Civic Center Way (west of Stuart Ranch Rd).

The Malibu Coastal Conservancy, a community-based, non-profit organization whose mission is to facilitate acquisition and restoration of open space and environmentally sensitive lands, has also focused its attention on acquiring the open space considered part of the Malibu Wetlands.
34. **Buffer Zones.** Develop and mandate site specific buffer zones for sensitive areas.

Within its park boundaries, State parks has identified areas where buffer zones could be established or improved to protect sensitive areas. One such site is located in Tapia Park. Here, State Parks redesigned the road system to better protect the riparian forest adjacent to Malibu Creek.

The Las Virgenes Municipal Water District, the City of Calabasas and the Santa Monica Mountains Conservancy co-funded ($3,000,000) the purchase of approximately 700 acres of open space adjacent to the District’s Rancho Composting facility as a buffer zone against urban encroachment. The City of Calabasas also instituted a development code requiring builders to ensure a 100-ft development setback (or other distance to be determined by a qualified biologist) from watercourses within their jurisdiction.

The City of Agoura Hills has established open space zones for its hillside areas and has adopted County designated “Significant Ecological Area” (SEAs) to help protect local natural resources.

35. **Habitat Fragmentation.** Develop and implement land use policy that will eliminate any additional habitat fragmentation. Support existing corridors between isolated open lands and establish alternatives where feasible.

Together, the National Park Service and State Parks have encouraged and funded habitat linkage studies within Malibu Creek State Park. Through a grant from the National Park Foundation, Canon USA, the Southwest Parks and Monuments Association, California State Parks and the National Park Service, a cooperative research effort was launched in 1996 to address critical concerns associated with carnivores. Because carnivores play a critical role in ecosystem functions and are indicators of ecosystem health, this long-term research will try to determine how urban growth and encroachment impacts carnivore habitat. Components of the study include: 1) radio telemetry to evaluate home range requirements, habitat needs and movement patterns for bobcats, coyotes, badgers and gray foxes, and 2) remote camera surveys to evaluate overall carnivore distribution patterns and to assess population sizes of marked animals. Results of the project will be incorporated into park planning and resource management activities to promote wildlife conservation in the
Santa Monica Mountains. Data on animal movement and critical habitat areas will also be used to guide park planning actions, land protection strategies and habitat restoration efforts.

The City of Calabasas established Open Space Districts through a section of its development code. These districts are intended to prohibit or limit developments in areas: 1) with important environmental resources, 2) with potential hazards, and/or 3) to maintain open space for wildlife habitat.

36. **Fish Barriers. Remove barriers to fish migration, especially Rindge Dam.**

Rindge Dam, which was constructed in 1924, is a 100-ft dam located on Malibu Creek approximately 2.5 miles upstream of Malibu Lagoon. By the late 1950s, the dam had significantly filled with sediment and no longer functioned as intended. The Army Corps of Engineers estimates that 800,000 – 1,600,000 cubic yards of sediment are trapped behind the dam wall today.

Starting in the mid/late 1990s, interest in removing Rindge Dam gained momentum and has since resulted in the formation of the Steelhead Recovery Task Force under the Malibu Creek Watershed Executive Advisory Council. Since its inception, the focus of this task force has expanded from just assessing the feasibility of removing Rindge Dam to addressing all creek barriers prohibiting steelhead trout from reaching valuable upstream spawning grounds. Heal the Bay, through its Stream Team activities, has surveyed 15 miles of Malibu Creek and mapped all barriers to fish passage in the watershed. While Malibu Creek remains the primary focus, several other creeks (Topanga, Solstice and Arroyo Sequit) are also being surveyed and documented for obstructions to steelhead migration.

---

24 Steelhead trout was added to the federal list of endangered species in August, 1998. See Restore/Enhance Malibu Lagoon and Surfzone (#20) for additional information.
Site Statistics

Rindge Dam is located approximately 2.5 miles upstream of Malibu Lagoon. The site selected for construction was the eastern end of a segment of the creek which runs west to east, where the canyon walls narrowed and the geology was most favorable for attaining structural strength and stability.

Design and Construction

Rindge Dam was constructed in 1924 and the adjacent spillway was completed in 1926. The dam was constructed in a constant arc radius design using Belgian cement and steel railroad rails for reinforcement. Its original purpose was to provide water for irrigation of ranch lands in the Santa Monica Mountains.

Capacity

The original reservoir capacity of the dam was 574 acre-ft (186 million gallons of water). By about 1956, the capacity had reduced to 50 acre-ft due to increased sediment deposits. By 1965, the reservoir was completely filled with sediment. It is estimated that Rindge Dam now holds approximately 10 million gallons of water within its sediment base.

Steelhead Recovery Task Force efforts led directly to the Army Corps of Engineers (Corps) involvement in assessing the feasibility of the alternatives presented for removing Rindge Dam. In early 1999, the Corps concluded an initial reconnaissance study which determined that there was enough support among watershed stakeholders to move forward with a feasibility study. Among other things, the study also concluded that removal of Rindge Dam and other Malibu Creek barriers would allow steelhead to access an estimated 4630 ft$^2$ of spawning habitat and 2 linear miles of rearing habitat within the Malibu Creek watershed.

The Corps is now planning a full-scale feasibility study which will assess various removal/mitigation alternatives, associated costs, timelines and federal interest. Potential alternatives include: 1) dam removal, 2) installation of conduits through the dam and reservoir, and 3) construction of a fish ladder.

Despite these efforts, the feasibility of steelhead’s survival in the upper watershed has been questioned by some who cite high temperatures, variable creek flows, contaminated discharges and other barriers as detrimental to the survival of the species. Although historical flow data indicates that Malibu Creek was an intermittent stream, several fish biologists looked at recent water quality/quantity data and found that current upper and lower creek conditions would not be detrimental to steelhead trout.

37. *Exotic Vegetation.* Support control of the intrusion of exotic plants into the wilderness areas of the watershed.

Controlling the spread of exotic vegetation in the watershed is, at best, a daunting task that requires endless effort and resources. More than 20 species have significantly impacted the Malibu Creek watershed and other
coastal regions, and their impact is cumulative. Table 2.4 highlights the watershed’s most significant non-native plant species. Some plants (grasses) have even changed the soil structure, making it nearly impossible for native species to grow.

Table 2.4. Exotic plant species found in the Malibu Creek watershed.

One of the most prolific exotic plant species found in lower and upper Malibu Creek Watershed is *Arundo donax* (also known as giant reed). This reed can grow as much as 2.5 inches per day and reach a maximum height of 27 feet. Its growth rate and rapid defense mechanism make it nearly impossibly to eradicate once an area has been invaded. The plant spreads primarily during floods when it is uprooted from upstream locations and transplanted further downstream. *Arundo donax* soaks up huge amounts of water, rapidly replaces native riparian habitats, obstructs wildlife access to waterways and is an extreme fire hazard. Data collected by Heal the Bay’s Stream Team shows that there is an enormous amount of *Arundo donax* in Malibu Creek, just below Malibu Creek State Park. Efforts are currently underway to remove it from a 2.5-mile reach of Malibu Creek, between Rindge Dam and Malibu Lagoon. Once removed, native species will be planted as necessary to create a healthy riparian canopy in areas disturbed by this invasive plant.\(^{25}\)

State Parks, Mountains Restoration Trust and Stream Team volunteers have identified and recorded non-natives throughout the watershed. Stream Team volunteers are even using global positioning system (GPS) devices and field guides which have plant identification keys to identify the

\(^{25}\) This is a cooperative project between the National Park Service, Santa Monica Mountains National Recreation Area (NPS), California Department of Parks and Recreation, Malibu Creek State Park; and Mountains Restoration Trust.
exact locations of several non-native plants found in riparian zones.

With assistance from the Los Angeles County Fire Department, State Parks has initiated four prescribed burns since 1996 to help control proliferation of milk thistle, an exotic species found on the parklands. They also manually remove, on a regular basis, substantial stands of yellow star thistle, sweet fennel, Arundo, Euphorbia and other exotic plants on the parklands.

Weed Warriors, a volunteer group coordinated by the California Native Plant Society and recruited by word of mouth, has removed invasive exotic vegetation (e.g., castor bean, ice plant, Arundo) from public lands throughout the Santa Monica Mountains since the mid-1980s. Some of their restoration locations include Sycamore Canyon, Cold Creek, Malibu Creek State Park, Lower Malibu Creek and Lagoon, and Bluff Park. The number of volunteers and volunteer hours recruited for restoration activities varies from location to location, but usually ranges somewhere between 1000-2000 hours each year. The frequency of restoration activities ranges from monthly to yearly, depending on the site. However, Weed Warrior’s efforts to remove non-native vegetation are significantly boosted immediately after a fire when re-sprouting, non-native plants are small and easy to remove. Heal the Bay has even begun to advertise Weed Warrior event dates in their monthly volunteer newsletter Sea Stars. Because Weed Warrior volunteers do not use heavy or powered equipment, they generally choose areas where a native remnant population still exists. This approach increases the success of their efforts because it improves the opportunity for native re-colonization once the exotics are removed.

The City of Malibu reviews all new development plans to ensure that invasive, non-native species are not planted. The City maintains and provides, upon request, a list of prohibited plants to applicants and landscape architects. City personnel also make recommendations on what types of native species to plant. However, the City does not require existing exotics to be removed unless it is required as mitigation for a project, or unless the plants are targeted by the County Fire Department as part of a fuel modification plan to reduce the threat of fire. The City’s Environmental Review Board will consider measures to increase the public’s awareness about exotic vegetation in their workplan to the City Council in February, 2000.

Most recently, a new sub-committee has been formed under Malibu Creek Executive Advisory Council – the Invasive Species Task Force.
Its mission is to identify, assess and initiate removal of invasive species in the watershed.

38. **Wetlands. Maintain, restore, create and enhance wetlands (natural and created).**

The Southern California Coastal Wetlands Inventory, which was established as part of Governor Wilson’s *1993 Wetlands Conservation Strategy*, identifies 39 coastal wetlands between the Point Conception and Mexican border. Malibu Lagoon is included in that inventory. The overall goal of the strategy has been to identify regional and statewide wetland restoration and enrichment opportunities. Information for each wetland in the inventory includes: 1) a map of the site’s historic perimeter, 2) a map of the site’s vegetative communities, and 3) a site profile documenting the wetland’s physical and biological characteristics. A comprehensive summary of Malibu Lagoon’s inventory information can be found on the internet at [http://ceres.ca.gov/wetlands/geo_info/so_cal.html](http://ceres.ca.gov/wetlands/geo_info/so_cal.html).

Locally, the City of Malibu completed a wetlands delineation for the Civic Center area. Only one site was identified as an existing wetland – a sump area approximately four acres in size which is located north of Civic Center Way and west of Stuart Ranch Road. The City is also considering plans for a constructed wetland/creek paralleling Civic Center Way. The wetland/creek would secure a connection between Malibu Creek and the existing wetland (pond) area to provide: 1) additional biological treatment for dry weather flows and 2) storm water detention in the event of flooding in the Civic Center area.

The Malibu Coastal Land Conservancy helped the City of Malibu secure a $150,000 grant from the Federal Emergency Management Act (FEMA) flood insurance plan to develop a city-wide flood mitigation plan. The plan will: 1) identify areas with repetitive flood damage claims, 2) develop appropriate mitigation measures, and 3) evaluate wetlands restoration as a potential flood mitigation measure in the Civic Center area.

In March 1998, the Las Virgenes Municipal Water District began rehabilitating a percolation pond as a constructed wetland. The pond, once rehabilitated, could be used to polish Tapia’s effluent and to treat urban runoff flowing from the upper watershed. However, there is some debate about what the constructed wetland is to be used for during the
Tapia’s summer discharge prohibition period each year.
Coordination and Outreach

39. **Coordinate on a Watershed Basis.** Create and implement a regional and subwatershed approach to the coordination of land use and water quality decisions for ongoing implementation concerns and to reduce unnecessary overlaps of ordinances and streamline regulations.

- **Develop guidelines to reconcile the attainment of water quality objectives and resource protection with other, possibly conflicting public service goals, such as fire protection, flood control, and geologic stability.**

The Resource Conservation District of the Santa Monica Mountains and other members of the Malibu Creek Executive Advisory Council have coordinated with the Los Angeles County Department of Public Works to establish new flood control channel clearing guidelines – guidelines that would preserve the maximum amount of habitat possible while ensuring public safety. As a result, new protocols were established for evaluating the necessary BMPs for each channel clearance site in the Malibu Creek Watershed. The protocols are now being used by FLORA as a model to inventory channel habitats and to develop recommendations for channel clearing in the Los Angeles River watershed.

LAC-DPW has also improved its BMP practices related to infrastructure construction, maintenance and repair of roads, culverts, bridges, etc. (as called for in the 1996 Municipal Storm Water NPDES permit). These measures help to minimize impacts on local habitats and reduce erosion and sedimentation problems common to these types of activities.

Please also see responses to Fire Regulation-Erosion Control (#11) and Recreational Use Impacts (#32).

- **Build support for the implementation of the mediation recommendations (research studies, ordinances, joint agreements, etc.) among agency staff and non-agency stakeholders who are working on management plans which affect the watershed - RCD/SCS Natural Resource Plan, SMBRP Comprehensive Conservation Management Plan, LA County NPDES storm water permit, City of Malibu Wastewater Management Plan, General Plans of area cities and the LA County 101 Corridor/Cities Area Plan Update.**

Several efforts which either build support for, encourage or mandate the implementation of management plan actions/recommendations have been highlighted throughout this report. In summary, these include:
• Formation of the Malibu Creek Executive Advisory Council and its subcommittees;
• The 1996 Municipal Storm Water NPDES permit requirements;
• Local municipal ordinances;
• Public education programs;
• Water quality improvement and habitat restoration pilot projects in the watershed; and
• The availability of Prop A bond funds.

Establish mechanisms, including joint powers authorities (JPAs), watershed commissions, special districts or other cooperative efforts for the integration of efforts aimed at coordinating, planning, and/or implementation where multi, general-purpose jurisdictions exist.

The Cities of Agoura Hills, Westlake Village, Malibu, Calabasas and Thousand Oaks formed a joint powers authority (JPA) called the Council of Governments (COG). The JPA’s governing board consists of one representative from each city and one ex-officio member representing the County of Los Angeles. The governing board then established a technical advisory committee (TAC) to review and make recommendations to the board as necessary. The COG meets monthly to review the TACs recommendations and to set priorities for the watershed as a whole. The formation of the COG has had several beneficial results, including:

• Creation of an operating budget to leverage city funds.
• Increased representation on regional committees in organizations such as the Southern California Association of Governments (SCAG) and the Metropolitan Transportation Authority (MTA).
• Adoption of priorities for the sub-region (transportation, open space preservation, watershed management, pollution reduction and public education).
• Securing funds totaling over $150,000 to study and set regional priorities.
• Promoting legislation that would provide incentives for property owners to donate land for open space.

Develop and field test interactive models to facilitate systems-based watershed planning and management decisions.

This action has not occurred. The National Park Service has been identified as the oversight agency, but there is no formal lead.

Identify and create appropriate financing options which work and are
cost effective, including joint financing options so duplication is
avoided.

Although no formal source of funding has been established or identified to
coordinate watershed planning efforts, agency stakeholders have been
quite successful in securing funds to conduct many of the actions called for
in the various watershed plans. Table 1.3, starting on page 12 in Section
One: Overview, summarizes many of the watershed’s major restoration
projects and studies.

The Joint Powers Authority mentioned above could also be a mechanism
for joint financing of watershed projects.

40. Enforcement - General. Develop effective means to enforce pollutant
reduction programs.

Local ordinances, developed by watershed cities under the 1996
Municipal Storm Water NPDES permit, have proved to be a creative
mechanism for establishing and enforcing local pollution prohibitions. For
example, local ordinances now call for developers to implement
appropriate, site specific BMPs regardless of the size of their construction
site; restaurants must not allow food waste to reach the storm drain
system, mobile car washers must comply with wastewater discharge
restrictions. Cities are also required to conduct “educational site visits”
for businesses regulated under the Storm Water NPDES permit program.
Although these visits are not used to enforce pollution reduction
programs, city personnel use the opportunity to help businesses
understand the rules and regulations governing polluted discharges.

Enforcement of the cities’ storm water ordinance prohibitions is primarily
passive in nature. Most city personnel do not “patrol” the streets looking
for violators, but rather rely on calls/complaints to 1-888-CLEAN LA or
to the city directly, or through “seeing” the violation take place.
Calabasas also uses the sheriff’s department to identify violators, and
Thousand Oaks routinely inspects restaurants, automotive repair facilities
and constructions sites for compliance. Once violations are discovered,
specific steps are taken to resolve them. The City of Westlake Village,
for example, employs verbal, written and even prosecution measures to
enforce pollution control measures. Enforcement activities do occur
through city inspector programs for some industrial/commercial and
construction sites, but this is not the case for every facility due to the
educational site visits mentioned above.
The City of Malibu and the Los Angeles County Department of Health Services conduct enforcement activities relating to illicit connections and malfunctioning septic systems in the Malibu Creek watershed. However, they are unable to provide staff to conduct these activities on a regular basis and thus rely on tips and complaints from the public to help identify and respond to such problems. Malibu has implemented a 24-hour Emergency Response Program in partnership with the County Sheriff and Fire Departments for septic spills and overflows. The City and the County Sheriff, Fire, and Health Departments are also notified to respond to 911 calls made by the public reporting any spills. In the event of a spill, both the City and County Fire Department are equipped to prevent spills from entering storm drains and take further action as needed. Code enforcement actions follow where necessary.

The Los Angeles County Department of Health Services approves the design aspect of septic systems but does not inspect them or regulate their maintenance and upkeep. Septic system installation permits are issued by LAC-DPW’s Building and Safety division as part of an overall building permit of a site. Once installed, the Health Services department only addresses septic system problems where public health is threatened and, like the City of Malibu, relies on complaints and tips to take enforcement action against violators.

In its report, “Omission Accomplished: The Lack of a Regional Water Board Enforcement Program, 1992-1997,” Heal the Bay strongly criticized the Regional Board’s enforcement activities relating to: 1) sewage, oil and hazardous substance spills; 2) industrial storm water violations; 3) illicit connections and poorly maintained or failing septic systems; and 4) NPDES and WDR permit violations. Since the Omission Accomplished report was released in 1998, the Regional Board’s enforcement activities have significantly increased as has its budget to conduct these activities. A complete summary of the LARWQCB’s enforcement activities are documented in quarterly reports which are available to the public.

41. **Enforcement - Camping.** Enforce existing camping restrictions within the watershed.

When necessary, State Parks removes transient encampments from state park property. They also patrol parklands for illegal campsites on a
regular basis and take appropriate action when such sites are encountered.

---

42. Public Education. Emphasize and encourage ongoing public education.

- Create a nonpoint source pollution education program for watershed occupants.
- Develop a Adopt-A-Watershed program that is watershed-wide.
- Implement effective education programs about the need for urban and non-urban preservation of open space and buffer zones.

Several watershed-based public education programs were addressed under Composting/Recycling/Conservation (#29) and Public Education: Conservation (#30). In addition to those outreach activities, many more are highlighted here.

- For more than 14 years, the RCDSMM has conducted field-based, year-round Marine Science Programs for students at Malibu Lagoon and Malibu Creek State Park. These programs are active, hands-on and participatory, emphasizing estuarine ecology, water quality and watershed dynamics. The programs further stress the problems caused by urbanization on wildlands, and provide solutions and watershed protection activities that students can incorporate into their daily lives.

The RCDSMM also produced the Stable and Horse Management BMP Manual for use by local horse owners and commercial stables (discussed previously under #18, Confined Animals). Complimenting this particular effort, Quint Cities\(^\text{26}\) worked with the RCDSMM to create a companion handout entitled Best Management Practices for Stable and Horse Management. Both are available to horse owners and commercial stable facilities in the Malibu Creek watershed.

- State Parks gives lectures to teachers in the Los Angeles Unified School District on the values of and need to preserve open space. They have also incorporated open space and watershed protection themes into State Park nature walks, school presentations and campfire programs.

---

\(^{26}\) Quint Cities is a consortium of Malibu Creek watershed cities which includes Malibu, Agoura Hills, Westlake Village, Thousand Oaks and Calabasas.
• The City of Agoura Hills has actively targeted local residents since 1993 with educational information on conservation, sediment reduction and nonpoint source pollution prevention. Their endeavors include: 1) sponsoring local advertising campaigns; 2) distributing flyers at community events and at City Hall; 3) sending mailers to local schools; 4) writing about conservation practices in the City newsletter (circulated to 8,000 residents); 5) contracting with the Department of Health Services to educate restaurant employees about BMPs; and 6) conducting educational industrial/commercial site visits. The City also created an Open Space Task Force in 1998 which subsequently developed the Open Space Preservation Plan (released Fall, 1999).

• The City of Calabasas has implemented several educational programs addressing open space and buffer zone preservation which are supported by City Council members and CTV (a local cable access channel which serves as a source of environmental information). The City promotes: 1) the availability of biking trails via regional biking fliers; 2) the use of the City’s parks through quarterly distribution of recreation booklets; and 3) the use of native, low water use plants (providing technical assistance on plant selection).

While the Open Space/Buffer Zone Preservation concept has City support, there are no specific guidelines for private property owners to follow and actual implementation of this concept is primarily left to the developer’s discretion. However, the Transportation Department is in the process of developing a master plan for trails in the city which will require most large developments to dedicate portions of their property to open space, and the City does prohibit new development activities within 100 yards of creeks and streambanks.

Although the process has been slow, Calabasas also initiated an Adopt-A-Creek program to raise awareness about local riparian habitats. As envisioned, the program will be structured to accommodate various levels of public interest, from people who just want to clean up trash to people who want to restore a creek bank on their property or who want to help monitor the health of stream habitats.

• The City of Malibu has plans to implement a pollution prevention advertising campaign using the City’s local cable TV channel, starting in November, 1999. The 30-second public service announcements will address how to prevent pollutants from reaching and entering the
storm drain system, ultimately polluting local streams and the ocean.

- The City of Thousand Oaks circulates a monthly newsletter, *On the City Scene*, to its residents which highlights a local recycling hotline number, composting and disposal opportunities, hazardous waste collection services, etc. Residents are also encouraged to visit the city’s website for up-to-date information on city events.

- In 1995, the County of Los Angeles Department of Public Works initiated a Five-year Storm Water Urban Runoff educational program, targeting residents throughout the entire County. The campaign provided information about various types of nonpoint source pollution such as used motor oil, pet waste, pesticides and herbicides, etc. All cities in Los Angeles County have been invited to join this effort and nearly all have accepted that offer, including the four Los Angeles County cities in the Malibu Creek watershed. Complimenting this five year campaign and building on its own efforts, LAC-DPW also launched the *Storm Water Urban Runoff* campaign and the *Used Oil Recycling* media campaign in 1999.

- Several of the Las Virgenes Municipal Water District’s Malibu Creek watershed education programs are highlighted under Composting, Recycling, Conservation (#29) and Public Education – Conservation (#30). Additionally, the District has conducted educational outreach about sensible irrigation practices and the values of landscaping with native species. For example:
  
  ➢ *Demonstration Gardens* were planted at District Headquarters, along Las Virgenes Road and in Gates Canyon Park. The gardens demonstrate the use of both native and non-native low water use plants.
  
  ➢ Soil moisture sensors were installed at Gates Canyon Park and Grape Arbor Park in the City of Calabasas.
  
  ➢ Landscaping software was developed in 1995 and is now routinely distributed by the District. It was also provided to local cities for their building permit plan checks. The software advocates for the landscape ordinance by helping residents understand the water needs for various types of plants and encouraging them to use drought-resistant, native species when landscaping their property.
Irrigation technical training is intermittently provided (in partnership with local cities) which addresses: 1) basic irrigation principles, 2) irrigation system adjustment, repair and troubleshooting, 3) basic and advanced controller programming and 4) irrigation scheduling.

- Heal the Bay has offered its *Speakers Bureau* program since 1989. This program, comprised of specially trained volunteers, educates local communities and businesses, school children, special interest groups and other interested parties about storm water pollution issues and how each person can make a difference. Heal the Bay’s speakers are available upon request and reach out to 25,000 people in Southern California annually.

In 1998, Heal the Bay launched the *Stream Team* program (mentioned several times throughout this report), which trains and educates volunteers about specific water quality and environmental health issues in the Malibu Creek watershed. Already, the program has trained over 75 volunteers to help measure water quality and to conduct surveys on pollution sources and degraded habitats throughout the watershed. Heal the Bay also participates in the Eco-Heros program. The program has educated over 360 students about the effects of nutrients, sediments, urban runoff, and other water quality impacts to Malibu Creek and its tributaries.

Businesses are also being targeted with educational outreach by a variety of agencies. For example:

- LAC-DPW visits industrial and commercial establishments to educate owners and employees about implementation of on-site best management practices.
- The Los Angeles County Department of Health Service conducts a mandatory training program for restaurants about implementation of storm water BMPs and making modifications to activities known to contaminate urban runoff.
- Through the SMBRP’s Public Involvement and Education (PIE) Fund, Quint Cities produced five pollution prevention brochures targeting: 1) painting contractors, 2) landscape and pool maintenance personnel, 3) contractors and site supervisors, 4) horse owners and 5) residents and homeowners. These brochures are available at the permitting counters in each city.
43. **Watershed Monitoring.** Develop and implement a coordinated and integrated watershed monitoring program.

- Create a centralized database of water quality and resource data accessible to all parties.
- Develop a coordinated GIS database network, including a detailed land use map with all septic systems and storm drains, which is accessible to all parties.

Although no centralized database has yet been created to house water quality and resource data, data collected by various agencies and studies is made available to all interested parties upon request. Many of these watershed monitoring efforts undertaken by watershed stakeholders have been highlighted throughout this report, including:

- Table 1.3, Watershed Restoration Studies/Projects (pgs. 12-15);
- Biological Standards (#5);
- Monitor Pathogens (#6);
- Study Nutrients (#8);
- Temperature (#12);
- Assess Sources/Characteristics (#21);
- Septic Systems (#23); and
- Irrigation Runoff Reduction (#31).

Other specific efforts are summarized here.

- In April 1999, the Monitoring and Modeling sub-committee (formed under the Executive Advisory Council) completed a draft plan calling for a coordinated watershed-wide monitoring program. Its recommendations include adding supplemental monitoring efforts to better establish a comprehensive survey of the state of the Malibu Creek Watershed. Implementation of this action is dependent on the availability of funds to carry it out.

- Through an agreement with two non-profit groups, the Natural Resource Defense Council and Environment Now, the Las Virgenes Municipal Water District contracted with UCLA to conduct a study entitled “Enhanced Environmental Monitoring Program at Malibu Lagoon and Malibu Creek.” During the study, monitoring was conducted over a two year period from 1993-1995 and the data was analyzed to assess the effects of Tapia’s effluent on Malibu Creek and Lagoon. Coincidentally, the study occurred both during one of the biggest fires in history and during an extremely wet year.
The report, released in 1995 and containing more than 100 pages of data, found no conclusive evidence of direct impact of Tapia’s effluent on Malibu Creek, Lagoon and local habitats.

• As mentioned under Public Education (#42), Heal the Bay launched a Malibu Creek watershed volunteer monitoring program called Stream Team and completed their first water quality training program September, 1998. Participants in the program now sample water at 7 fixed stations throughout the watershed on a monthly basis. Two of these sites, which are minimally impacted by upstream activities, have been designated “reference sites.” Another two sites overlap with the RCDsMM/City of Calabasas monitoring sites to assure the quality of data being collected. The monitoring locations are recorded using GPS devices, and the data collected is then organized using GIS capabilities. Observations and data collected include: 1) location of discharge points and outfalls, 2) presence of unstable bank conditions, 3) evidence of artificial streambank modifications, 4) impacting land uses, 5) presence of exotic/invasive vegetation, 6) possible barriers to fish migration, and 7) evidence of illegal dumping. A 150-page illustrated field guide was also developed for Heal the Bay’s Stream Team activities by graduate students from the Cal State Pomona Landscape Architecture program. The guide includes step-by-step procedures for water quality monitoring.

Heal the Bay recently started Phase 2 of this volunteer program, which includes: 1) volunteer training to continue monitoring efforts for years to come, 2) professional assessment of benthic macroinvertebrates (conducted by the CA Department of Fish and Game), and 3) the addition of enterococcus to the list of water quality parameters currently measured. Heal the Bay plans to make Stream Team data available on their website.
Heal the Bay has also started creation of a database for monitoring data taken in the Malibu Creek watershed (see Figure 4) and is using GPS to accurately locate other agency/monitoring group and rain gauge stations. To date, the monitoring sites for Calabasas, RCDsMM and the LVMWD have been logged. Ultimately, Heal the Bay plans to become a clearinghouse for all of the monitoring data collected.

Other monitoring data available to the public include: 1) water quality, biological monitoring and surveys of Malibu Lagoon, conducted by RCDsMM (see Assess Sources/Characteristics, #20); 2) volunteer monitoring in the upper watershed, sponsored by the City of Calabasas; and 3) coliform bacteria monitoring in the surf zone, conducted by the Malibu Chapter of Surfrider.

44. **Watershed Assessment.** Identify, by subwatershed area, sources of harmful pathogens, toxic chemicals, sediments and nutrients.

- Expand an understanding of the hydrology of the watershed and nearshore bathymetry. Agree on needed research on what appropriate and attainable seasonable flows should be for Malibu Creek, Lagoon and nearshore areas.

At the request of the National Marine Fisheries Service (NMFS), LVMWD conducted a study in 1998 to determine the minimum creek flow needed to sustain steelhead trout populations. Using their own outdoor water audit method and plant types/water needs information collected from the National Park Service and UCLA, the District concluded that a minimum flow (in dry years in late October) of 2-4 cubic feet per second (cfs) recorded at the County gauge station was necessary to ensure at least 1 cfs of flow below Rindge Dam (one cfs is the flow criteria established by NMFS to sustain steelhead trout).
- Identify and apply suitable models to help target and prioritize pollution prevention, reduction and abatement measures.

This action, a fundamental component of several other actions, is summarized in Protect Beneficial Uses (#1), Assess Sources/Characteristics (#21), Runoff Reduction (#31), Habitat Fragmentation (#35), Coordinate on a Watershed Basis (#39) and Monitoring Efforts (#43).

- Raise funding for and implement study on the health effects of urban runoff on surfers, incorporating Surfrider Beach into the design.

In 1995, the Santa Monica Bay Restoration Project conducted an epidemiological study (“Epi Study”) to assess the health effects of those who swim directly in front of flowing storm drains. Malibu’s Surfrider Beach was one of three locations used in this study. Results of the study showed, conclusively, that there is a significant increase of occurrence in illnesses among those swimming within 100 feet of flowing storm drains. A complete summary of this study is provided under Public Notices (#25).

Some watershed stakeholders would like to see another epi study conducted that specifically assesses the health-related impacts of surfers using Surfrider Beach. However, the Human Health subcommittee reviewed this possibility with Dr. Charles Gerba (University of Arizona) and concluded that: 1) there were not enough users that could be interviewed in one season to give the study statistical validity, and 2) it's also not clear who would serve as the “control” group for such a study.

- Establish a Total Maximum Daily Load (TMDL) model for all inputs to the watershed.

The Regional Board has been charged with determining how much of a pollutant can be assimilated into a water body without impairing its health and function, i.e., establishing a TMDL. This process, although required in the Clean Water Act for more than a decade, has only just begun. The Regional Board has established a TMDL unit to set discharge limits for pollutants throughout Los Angeles County. In the Malibu Creek watershed, TMDLs are to be developed for nutrients and pathogens/coliform by March, 2002.
- Develop a research agenda to expand understanding about impacts of land use practices in the watershed.

The LVMWD hopes to coordinate its GIS use with data collected from Heal the Bay and others to better understand land use impacts in the watershed. One such application would be to overlay stream location data with district water use data and storm drain locations to better determine where runoff control and treatment efforts would have the greatest impact.

* Asterisk (*) indicates tasks that are critical for the success of the project.
SECTON III: KEY FINDINGS

Over the past decade, an enormous amount of energy has been invested into making restoration of the Malibu Creek watershed a reality. These efforts have ranged from establishing an Executive Advisory Council and contributing countless hours for stakeholder meetings to creating a set of restoration priority actions and implementing them. And, while not all of the 44 actions identified in this report have been fully, or even partially implemented, there has been a measure of progress towards achieving their stated objectives. Table 3.1 highlights ten of the most significant accomplishments towards watershed restoration. This list represents the efforts of the entire stakeholder group through its partnerships, review committees, creative funding sources, technical support and hands-on restoration activities.

Section III summarizes the key findings of Section II: Action Plan Update. More specifically, it evaluates progress made to achieve the goals of the Malibu Creek Watershed Plan in relation to the key issues of concern in this watershed, i.e., water quality and quantity, solid waste, land use practices, habitats and coordination/outreach efforts. The preceding page provides a snapshot of the results of this assessment, i.e., how well the Plan’s 44 actions have been implemented and whether they have made minimal, moderate or substantial progress. Because some actions address multiple issues, they are assessed in each section of relevance. For example, implementing confined animal BMPs affects water quality, solid waste disposal and land use issues, hence a separate summary has been provided in each of these sections.

The reader should keep in mind that as this report is being written, new programs are beginning which

Table 3.2. “Top Ten” watershed restoration accomplishments.

27 Based on the information provided in Section Two: Action Plan Update, each action was evaluated by members of the Malibu Creek Executive Advisory Council on a scale of one to five according to how well it has met its intended goal(s). The scores submitted for each action were combined, the average taken and the results correlated to a rating of minimal, moderate or substantial progress (similar to a grade point average).
address some of the issues that have made no progress and/or have received very little attention before this time. For example: 1) the Santa Monica Bay Restoration Project has convened a Septics Management Task Force to develop recommendations for septic system placement, management, monitoring and replacement frequency and 2) the Lower Malibu Creek and Lagoon Task Force is addressing the feasibility of a constructed wetland in the Malibu Civic Center area. Although mentioned, these new efforts are not being evaluated in terms of their contribution towards successful implementation of the plan’s 44 action items.

Note: For your reference, the numbers located next to each of the following summaries in this section correspond to the same actions discussed in Section II: Action Plan Update.
Goal: Improve Water Quality to Protect Beneficial Uses

Eighteen of the Malibu Creek Watershed Plan’s actions address water quality issues, accounting for more than 40% of the Plan’s total number of actions. Improving water quality key to the overall success of watershed restoration and protection efforts. For review purposes, these eighteen actions have been divided into two major categories – Policy & Research and Implementation. The actions in the first category, Policy & Research, have achieved moderate success over the last five years as many studies and coordinated assessment efforts have been conducted to improve our understanding of the state of water quality in the watershed. On the other hand, implementation efforts designed to improve water quality have lagged significantly since the Plan was adopted in 1994. Below is an in-depth assessment of both how much and how little has been done towards understanding and improving water quality in the Malibu Creek watershed.

Policy & Research Activities

Seven of this section’s 18 actions address Policy and Research needs in the Malibu Creek watershed. Overall, they have achieved moderate success, with a one notable highlight. A summary of their relative success is provided here.

Substantial Progress

Monitor Pathogens

Moderate Progress

Develop and Set Water Quality Objectives
Establish Minimum Biological Standards
Determine Nutrient Standards
Assess Lagoon Characteristics
Landfill Impacts on Water Quality
Watershed Assessment

Monitor for Pathogens and Bacteria (#6)
The most significant progress made in addressing key water quality impairments in the Malibu Creek watershed has been in monitoring for bacteria and pathogens. Monitoring for indicator bacteria (i.e., total and fecal coliform) helps to determine whether human pathogens are present Malibu’s local waterways and if the waters pose any health risks. Such monitoring has been conducted in the Malibu Creek watershed on a regular basis by several agencies and organizations for more than a decade, and includes data from samples taken during both the wet and dry seasons. Additionally, two separate studies have been conducted in the past seven years in Malibu Creek to directly test for pathogens. Because this type of testing is prohibitively expensive, it has not been conducted on a more regular basis.
Our understanding of the location and amount of bacteria and pathogens present in the watershed has significantly increased due to these studies and monitoring efforts. Collectively, the data gathered conclusively shows that bacteria (and mostly likely pathogens) have been and continue to be a significant water quality problem throughout the watershed. While the data is exhaustive in highlighting the extent of the bacteria/pathogen problem, unfortunately, it does not always pinpoint the source(s) of contamination and their relative contribution(s). The next step towards decreasing pathogen loads is to identify these sources and systematically prevent them from reaching local waterways.

**Moderate Progress**

Six actions under *Water Quality: Policy and Research* have been implemented with moderate success. These include:

- Develop and set water quality objectives to protect beneficial uses;
- Establish biological (habitat) standards for native species;
- Determine nutrient standards;
- Assess Malibu Lagoon’s characteristics;
- Assess the impacts of landfill operations on water quality; and
- Conduct watershed assessment.

**Develop and Set Water Quality Objectives to Protect Beneficial Uses (#1)**

The Regional Board is charged with the task of developing and setting water quality objectives for waterbodies in the Malibu Creek Watershed, and they have experienced relative success in areas such as: 1) establishing discharge limits for point sources through the permitting process, 2) adopting the 1996 Storm Water Municipal NPDES Permit, and 3) creating a TMDL unit to begin establishing additional water quality objectives for impaired water bodies in the region. However, limits have not been established for non-point source discharges (storm drains, rainfall runoff, landscape irrigation, etc). To control pollutants generated from non-point sources, the Regional Board has created a TMDL unit which is currently in the process of establishing discharge limits for the watershed’s primary pollutants of concern – pathogens and nutrients. However, this process is slow. Limits are not expected to be set for pathogens and nutrients until 2001 and not at all for other pollutants such as oil and grease, trash and debris, and heavy metals. Despite the significant limitations placed on Tapia treatment plant discharges, other sources of pathogens and nutrients still adversely impact the beneficial uses of the watershed’s receiving waters.
Establish Minimum Biological (Habitat) Standards (#5)
Several habitat restoration activities, such as establishing mud flats in Malibu Lagoon, determining minimum flows to support steelhead populations, and removing exotic species, have resulted in some progress towards improving habitat to support native species. However, establishing water quality objectives based on biological standards has not been as successful. As the Coastal Conservancy/UCLA report states, “while there is much water quality data available, there is little information available about the tolerances of most of the target species to the physical condition of concern.” Setting water quality standards is a difficult task without appropriate background information. To come up with sound water quality objectives which take into concern local species needs, their tolerances must be known. Then, where competing needs exist, they should be prioritized for protection, and a balance maintained that supports the most native species possible. More information is needed on the tolerances of native species before this action can be fully implemented.

Determine Nutrient Standards (#7)
Our understanding about the amount of and impacts resulting from nutrient loadings in the watershed is also quite comprehensive, due mostly to the long-term research data collected by several key agencies. Although monitoring efforts have provided a clear picture of the extent of the problem, there is much debate over how to control nutrient loadings, and what discharge limits would be most appropriate given various watershed dynamics such as canopy cover, stream velocity, still pools, water temperatures, etc.

Recently, the Regional Board’s TMDL unit has begun to assess the nutrient data available and are in the process of establishing limits for nutrients in the Malibu Creek. Efforts to control/reduce nutrients are discussed under Water Quality: Implementation, below.

Assess Malibu Lagoon Characteristics (#21)
A portion of this action has been quite successfully accomplished but some additional steps need to be taken to complete the action as a whole. The Coastal Conservancy/UCLA study, along with other long term monitoring efforts, provides a quite comprehensive picture of the hydrology, circulation, and biota of the lower creek and lagoon, as well as management recommendations on how to improve/protect the area. Next steps include identifying all the potential and existing sources of pollution/contamination and then developing a remediation strategy to improve the lagoon and surfzone’s water quality based on these sources. The Lower Malibu Creek and Lagoon Task Force is currently in the process of ranking the UCLA study’s management recommendations and will soon release an action plan of
priorities based on the report’s recommendations. Completion of the CSCC/UCLA study represents a significant step towards assessing Malibu Lagoon’s characteristics.

**Assess Impacts of Landfill Operations on Water Quality (#27)**
The County Sanitation District of Los Angeles County is the primary agency responsible for landfill operations. Measures to mitigate the impacts of landfill operations (e.g., research, land acquisition, native plant restoration) were approved and adopted in 1998 and are currently being implemented and/or planned for the near future (see page 51). For example, the results of an ongoing groundwater monitoring study of the land directly below and surrounding the landfill will direct upcoming restoration and watershed protection efforts. While still too early to assess the benefits all of these measures will have on water quality, those already being implemented represent progress in the right direction.

**Conduct Watershed Assessment (#44)**
This action contains four subsets which address sources of pathogens, toxic chemicals, sediments and nutrients. As a group, they have been given a moderate rating, although individually some have been very successful, while others have not.

- The first sub-action, which calls for determining adequate seasonal flows for Malibu Creek, Lagoon and nearshore areas, has achieved minimal success. Only one study has been conducted to correlate minimum creek flow requirements with habitat needs (steelhead trout). Although Tapia no longer discharges flows during the dry season, discharge of imported water upstream and higher groundwater tables have permanently altered the creek’s flow regime, which is now perennial rather than intermittent or seasonal. How best to address this issue is a daunting task because it requires the resolution of some related controversies (e.g., year-round diversion of Tapia effluent, diverting urban runoff, minimizing import water demands, retaining runoff on-site).

- The second sub-action calls for conducting a study on the health effects of urban runoff on surfers and swimmers. The SMBRP Epidemiological Study, conducted in 1995, did exactly this and was completed with great success. The results of the study showed conclusively the link between contaminated urban runoff and swimmer illness. Based on these results, several measures were taken to inform the public about health risks and to provide alternatives about where and when to swim in the Bay. The results of the study have also been referenced in developing bathing standards at both the state and federal levels.
• The third action, which calls for establishing TMDLs for all inputs into the watershed, has been only marginally implemented. Although the Regional Board has established a TMDL unit, limits for the watershed’s pollutants of concern (nutrients and pathogens) will not be established until March of 2002. Furthermore, the Regional Board has no immediate plans to undertake additional TMDLs for the Malibu Creek Watershed for constituents such as heavy metals, trash and debris and other contaminants associated with urban runoff.

Establishing TMDL limits for impaired water bodies is designed to help improve water quality over the long run, however, the effects of this process will not be immediately evident. Once TMDLs for nutrients and pathogens are established, it will take additional time to change and/or improve how permits are issued to implement appropriate control measures.

• The last action, which calls for developing a research agenda to expand understanding about the impacts of land use practices in the watershed, has made no significant progress. Several agencies have stated their desire to use GIS applications towards understanding land use impacts, but funds and staff time to implement this action have not been forthcoming. Watershed cities are addressing development issues through their municipal master plans, but these efforts are not comprehensive and do not consider the watershed as a whole. The formation of the regional Council of Governments may help bring the need for true watershed planning to the attention of those responsible for the development activities occurring in each city.

Water Quality – Policy and Research Grade: B-/C+

Water Quality - Implementation

Eleven water quality actions are considered as “on-the-ground” implementation efforts. Collectively, their success has been somewhat limited, as the call-out box on the next page shows. It is interesting to note that no actions in this section have been rated as substantial. An assessment of their relative success is provided here.
Moderate Progress

Seven of this section’s 11 actions have achieved moderate success. These include:

- Eliminate or reducing sources of harmful pathogens, toxic chemicals, sediments and nutrients;
- Reduce accelerated sedimentation;
- Implement stenciling and other storm drain BMPs;
- Regulate mobile car wash discharges;
- Eliminate illegal drains;
- Control trash on parklands; and
- Implement confined animal BMPs.

Eliminate Sources of Harmful Pathogens, Toxic Chemicals, Sediments and Nutrients (#4)

Passage of the 1996 Municipal Storm Water NPDES permit is key to the progress achieved in implementing this action. It represents the first critical step in implementing this action successfully. The permit not only requires cities to address sources of contaminated runoff, it also requires that they secure the authority to enforce such control measures. Municipal ordinances have now been adopted by every city covered under the storm water permit which stipulate storm drain discharge prohibitions.

However, enforcement actions taken to control contaminated discharges have not been significant since the ordinances were adopted. Cities, lacking personnel and funding to effectively enforce discharge prohibitions, rely on citizen complaints, site visits and educational programs to carry out this action. And, while city personnel do conduct site visits, they lack the staff resources to make return visits on a regular basis. For example, a parcel of land being developed is visited, on average, only once during its construction phase. This is inadequate because the condition of a construction site change dramatically over the course of its development.

More specific information on reducing and/or eliminating pathogens, sedimentation and nutrients are addressed below.

Reduce Accelerated Sedimentation (#10)

Six components are listed under this action and, together, they provide a comprehensive plan for reducing human-induced sedimentation. The components include enforcing erosion control measures, preventing sediment

\[
\text{\textbullet\quad Eliminate Sources of Harmful Pathogens, Toxic Chemicals, Sediments and Nutrients} \\
\text{\textbullet\quad Reduce Accelerated Sedimentation} \\
\text{\textbullet\quad Implement Stenciling and Other Storm Drain BMPs} \\
\text{\textbullet\quad Regulate Mobile Car Wash Discharges} \\
\text{\textbullet\quad Eliminate Illegal Drains} \\
\text{\textbullet\quad Control Trash on Parklands} \\
\text{\textbullet\quad Implement Confined Animal BMPs} 
\]
runoff from development projects, adopting erosion control ordinances, implementing BMPs to minimize topsoil loss, preventing roadside dumping of dirt and eliminating massive grading practices.

Mechanisms, such as local ordinances, educational pamphlets and site visits, and construction NPDES permits do bring awareness about sedimentation issues to developers and residents. Cities also require and review erosion control plans for planned and active construction sites, and they require BMPs to be implemented to minimize sedimentation problems. These actions, while proactive and a good start, have not clearly reduced human induced sedimentation into the watershed. Due to limited resources, city personnel are unable to effectively ensure that the BMPs will be implemented over the entire duration of construction. Roadside dumping of dirt has proved virtually impossible to control, and topsoil losses from residential sites remains a concern in developing and newly developed residential neighborhoods.

Implement Stenciling and Other Storm Drain BMPs (#13)
Storm drain stenciling efforts have been well implemented throughout the watershed. Most watershed cities contract with the County of Los Angeles Department of Public Works to conduct this task approximately every three years (Malibu stencils its own storm drains). The stencils are one of the methods used to make residents aware of where storm drain flows eventually end up.

Unfortunately, it’s still not uncommon to find catch basins clogged with urban-generated trash and debris, and contaminated discharges are still making their way into the storm drain system. Street sweeping and catch basin cleaning frequencies vary among cities, as do the storm drain cleaning techniques used. However, it’s not clear that street sweeping frequency is related to need in the watershed cities. The fact that there is very little data available supporting the benefits of street sweeping has resulted in municipal reluctance to do more on this issue, and no studies have adequately linked land use activities with the volume of trash collected to better determine what frequency would be most cost effective.

Regulate Mobile Car Wash Discharges (#14)
Mobile car wash operators are required under municipal ordinances to ensure that their discharges do not reach local storm drains. Because mobile car wash operations have not been found to be a significant source of water quality impairments to the Malibu Creek watershed, they are not heavily monitored by municipal staff unless complaints are filed. Beyond adopting local ordinances, there is little effort given to address/prevent mobile car wash discharges.
Eliminate Illegal Drains (#15)
Of the 1,838 illicit connections found in Los Angeles County, only 49 were located in the Malibu Creek watershed. The County has already formally documented 21 of these illicit connections and is in the process of documenting the remaining 28. Although there is nothing remaining to accomplish under this action, it only received a moderate rating due to completing documentation of the remaining storm drains.

Control Trash on Parklands (#17)
Efforts to reduce or eliminate the amount of trash from parklands reaching Malibu Creek have been only moderately successful. While State Parks does provide trash receptacles on its property, some of them are either not properly placed to maximize use among visitors, or there simply aren’t enough trash cans to hold all that is discarded on a typical weekend day by park visitors. More and better placement of trash cans and bilingual signs are needed to help decrease the amount of trash and debris making its way into Malibu Creek.

Implement Confined Animal BMPs (#18)
[This action primarily addresses horse owners in the Malibu Creek Watershed, most of which are located in the City of Malibu. There are not a significant amount of other types of livestock in this region.]

The Resource Conservation District has made a tremendous effort to monitor, educate and raise awareness among horse owners about the impacts of horse waste on water quality. Unfortunately, changes in manure management measures have not been widely observed since this outreach program began a few years ago. The region’s larger stables do implement BMPs designed to control manure and keep it from reaching nearby streams. However, many private horse owners with corrals located near streams do not necessarily have the land or resources to reconstruct their corrals away from adjacent streams. Additionally, municipal ordinances and the Los Angeles County health code are either not adequate or are not being sufficiently enforced to prevent horse manure from contaminating runoff. Horse waste is still observed in and around stream banks and riparian corridors, and in many creek/stream reaches. More attention on enforcing local ordinances and public health codes is needed to ultimately correct this problem.

Minimal Progress

There has been only minimal progress for four Water Quality:
Implementation actions. These include:

- Reduce human pathogen inputs;
- Reduce nutrients;
- Manage septic system discharges; and
- Enforce pollution reduction programs.

**Reduce Human Pathogen Inputs (#7)**
Historically, efforts to implement this action focused on eliminating Tapia Treatment Plant discharges into Malibu Creek while other diffuse or nonpoint sources were not aggressively pursued. These efforts resulted in the Regional Board passing a revised discharge prohibition eliminating flows during the dry season. It was a significant step towards reducing public fear about adverse health effects associated with tertiary treated discharges into Malibu Lagoon. However, bacteria counts are still higher than health code standards allow and Surfrider beach still consistently receives “F” grades during breaching events. Identifying and preventing other sources of pathogen inputs has not been given significant attention until very recently. These potential sources include septic systems, storm drain discharges and livestock wastes. Because programs to address these sources are just getting underway, this action received a minimal rating. It is too early to assess whether all the various sources of pathogens can be effectively controlled.

**Reduce Nutrients (#9)**
Excess nutrients are a wide-spread concern throughout the watershed both above and below the Tapia treatment plant. Although many studies have documented the extent of nutrient problems watershed-wide, little has been done to determine the extent of all the possible sources contributing to the excess nutrients found in the watershed. And, despite the discharge prohibition of Tapia effluent during the dry season, the amount of nutrients found in the lower creek and lagoon are still too high and cannot be accounted for, making it nearly impossible to develop a plan of action for reducing nutrient inputs. Until all sources of nutrients have been identified, this action cannot be effectively implemented.

**Manage Septic System Discharges (#23)**
It is widely believed that septic system discharges contribute to the poor water quality observed in the lower creek and lagoon, but studies recently performed to ascertain the degree of pathogen contributions coming from septic systems are considered inconclusive, and funds to conduct extensive groundwater monitoring have been nearly impossible to secure.
How best to manage septic system discharges has proven to be quite controversial. Homeowners are leery of government intervention, fearing that any changes to current systems would cost them thousands of dollars. City leaders have been reluctant to impose additional restrictions on local homeowners or to suggest construction of a centralized sewer system in Malibu. The SMBRP’s Septics Management Task Force is in the process of developing recommendations for how to manage septic discharges to better protect water quality in areas such as Malibu. These recommendations will require action by both state agencies and local municipalities.

Ultimately, very little progress has been made towards actually eliminating or reducing the impacts of septic system discharges on water quality. The actual number of installed septic systems in Malibu has not been determined or mapped, and only a small percentage of systems have been recently replaced.

**Enforce Pollution Reduction Programs (#40)**

Enforcing pollution reduction programs is carried out at several levels of government – local, state and federal. Cities have been required to adopt ordinances, and the State Water Resources Control Board and the US Environmental Protection Agency have the ultimate responsibility to ensure that water quality is protected. Both the State and municipalities use enforcement as a means to achieve this goal. Although these mechanisms are in place, almost no enforcement programs have been effectively implemented. Cities, lacking personnel and other resources to conduct all the enforcement that would be necessary within their jurisdictions, have done so only passively. And, until recently the Los Angeles Regional Water Quality Control Board has had an extremely poor enforcement record regarding oil and other hazardous substance spills, sewage spills, and storm water and other NPDES permit violations. However, since 1998 enforcement actions have taken place within the Malibu Creek watershed.
Goal: Reduce Excess Flows into Malibu Creek

The goal of the following three actions is to reduce excess flows into Malibu Creek. These actions intent to: 1) reduce imported water demands and runoff volumes, and 2) maximize the use of recycled wastewater. Collectively, they have been poorly implemented, with moderate progress in only one instance.

**Reducing Excess Flows**

<table>

<tbody>
<tr>
<td>Minimal Progress</td>
<td>Household Irrigated Runoff Survey</td>
</tr>
<tr>
<td></td>
<td>Runoff Reduction Measures</td>
</tr>
</tbody>
</table>

**Moderate Progress**

*Maximize Use of Reclaimed (Recycled) Water (#28)*

The Las Virgenes Municipal Water District, the lead agency responsible for promoting reclaimed water use in the watershed, has made significant strides in its efforts to recycle tertiary treated wastewater back to the communities that generate it. Efforts which include getting ordinances passed to require the use of recycled water where feasible and pricing recycled water more competitively have resulted in almost half (44%) of the total volume of wastewater generated by upstream communities being reused rather than discharged to Malibu Creek. Some of the alternatives proposed in the *Malibu Creek Discharge Avoidance Study* are also being implemented to maximize use of recycled water. For example, the District has: 1) increased the number of private end users during the prohibition, effectively doubling the non-creek disposal capacity of Tapia’s tertiary treated effluent and 2) sought funding opportunities to help pay for the infrastructure needed to reach distant but potential end users.

Unfortunately, the demand for recycled water is not constant throughout the year and thus less wastewater is recycled in the fall, winter and spring months than during the summer and shoulder months. As a result, excess flows are still discharged to Malibu Creek during the rainy season (November 15th – April 15th). Implementing alternative disposal options during this time has proved more difficult to address and has thus been fairly slow. Still, the District’s commitment to exploring several of the discharge alternatives identified in the report and to ultimately find a permanent alternative to discharging effluent into Malibu Creek is a positive step towards maximizing use of recycled water.

Watershed cities have also supported this action by passing ordinances requiring the use of recycled water for landscape irrigation along freeway corridors, in city parks, and other areas where feasible. Such requirements
help solve two problems simultaneously – they reduce the amount of wastewater discharged into Malibu Creek during the rainy season and decrease demand for imported water.

**Minimal Progress**

*Household Irrigation Runoff Survey (#19)*
The intent of this action was to conduct a survey which would: 1) provide insight as to why such large volumes of runoff are coming from residential developments and 2) develop an awareness campaign based on the survey results to decrease these excess runoff volumes. Although there are several public education campaigns promoting water conservation at the residential level, no household survey has been conducted to determine why excess flows are coming from residential areas. Without the insights that such a survey could provide, it will be difficult to plan an educational awareness campaign specifically targeting those activities most likely to contribute to excessive household-generated runoff.

*Runoff Reduction Measures (#31)*
Measures designed to reduce the amount of runoff coming from residential and commercial properties have only recently been adopted by local and state agencies. For example: 1) in the last few years watershed cities have passed ordinances calling for more pervious surfaces in new developments; 2) in January 2000, the Regional Board adopted a measure requiring on-site storm water retention or treatment for the first ¾-inches of rain from each storm; and 3) the Las Virgenes Municipal Water District recently installed irrigation sensors to improve irrigation practices to minimize excess flow. Because these measures have been only recently adopted and implemented, whether or not their implementation will prevent increased runoff or actually lead to reductions in runoff remains to be shown. And, because two of the three efforts mentioned above only apply to new and substantial redevelopment projects, the effects of this measure will not be clear until new, isolated developments can be evaluated for runoff reduction. Finally, beyond the public education/outreach efforts implemented, other immediate efforts to reduce runoff in the Malibu Creek Watershed are not widely observed.

**Reducing Excess Flows Grade: D**
Goal: Improve Management of Solid Waste

The three actions addressing solid waste concerns in the Malibu Creek watershed have achieved relative success, overall rating at high end of moderate. The ultimate goal of these actions is to prevent trash and other forms of solid waste from reaching and adversely impacting watershed creeks, riparian corridors and habitats. A summary of how well these actions are being implemented is provided below.

**Substantial Progress**
Composting, Recycling & Conservation

**Moderate Progress**
Control Trash on Parklands
Implement Confined Animal BMPs

Composting, Recycling and Conservation Measures (#29)
Combined, watershed agencies and municipalities have conducted an enormous amount of outreach promoting the values of composting, recycling and water conservation. They have also provided many opportunities for residents to participate in recycling and conservation efforts through programs like curbside recycling, household hazardous waste roundups, permanent used oil drop-off sites and workshops. While not necessarily cost-effective, these efforts have been successful in increasing public awareness of the need to recycle household waste and have led directly to the increased volumes of residential solid waste collected each year.

Moderate Progress

Two actions have made moderate progress in controlling specific types of waste found in the watershed. These include:

- Reducing the amount of trash found on local parklands; and
- Implementing confined animal BMPs for waste reduction.

Control Trash on Parklands (#17)
Local parks in the Santa Monica Mountains receive a large number of visitors every weekend, particularly to Malibu Creek State Park and Malibu State Beach and Lagoon. Much of the trash found in nearby creeks and the lagoon ultimately comes from park visitors. Whether it is left on the ground, placed in on-site receptacles but then raided by birds or blown out by the wind, too much trash is reaching the creek. State Parks has made moderate progress in its efforts to control the proliferation of trash on its properties through: 1) the installation of new and additional bird proof receptacles in areas of the park.
most frequented by the public, 2) posting bilingual signs encouraging visitors to use the receptacles provided and 3) utilizing Spanish-speaking employees to enhance its educational efforts. Although these approaches have been somewhat successful, they could be improved by installing even more bird-proof trash receptacles within State Parks boundaries and placing them in the most popular areas of the parks. State Parks’ efforts could also be enhanced by improving the visibility and location of its bilingual signs.

**Implement Confined Animal BMPs (#18)**

While ensuring proper management and disposal of the solid waste generated by large domestic animals is a daunting task, some key steps towards accomplishing this goal have been taken. The *Horse and Stable Management BMP Manual* and a video created by the RCDSMM provides very specific information on how to manage horse waste. A horse manure composting demonstration site was also created to reinforce the benefits of managing horse manure through composting. These educational tools are very informative and are available to horse owners and the general public. However, as stated in the action summary, it is not clear that this information is in fact reaching enough horse owners. While large stable operations do implement good manure management measures, smaller stables where only a few horses are kept need more focused attention to help them properly manage animal waste.

**Managing Solid Waste Grade: B-**
**Goal: Improve Land Use Management in the Watershed**

**LAND USE MANAGEMENT**

**Substantial Progress**
- Fire Regulation & Erosion Control

**Moderate Progress**
- Reduce Accelerated Sedimentation
- Implement Confined Animal BMPs
- Public Access & Resource Protection
- Habitat Fragmentation
- Enforce Camping Restrictions

**Minimal Progress**
- Buffer Zones for Sensitive Areas

Seven actions address land use issues in the Malibu Creek Watershed. Of the five that fall within the range of moderate progress, several of them were actually rated “low moderate.” The intent of these actions is to ensure that smart land use decisions are made to protect valuable habitats throughout the watershed. Such planning ranges from improving habitat fragmentation to controlling pollution caused by certain land use activities. In the Malibu Creek watershed, current conventional zoning requirements do not adequately protect riparian habitats, creeks and streams. Below is a detailed summary of how effectively these actions have been implemented.

**Substantial Progress**

**Fire Regulation and Erosion Control (#11)**

Only one action, Fire Regulation and Erosion Control, is considered to have made substantial progress in the Land Use category. Four years ago, the Los Angeles County Fire Department implemented a new program, called the *Fuel Modification Program*, to improve fire safety measures for residential and commercial developments. Recognizing the need to also control unnecessary erosion from residential properties, the Fire Department included in its new program standards which allow grass to remain on flat lands and slopes prone to erosion. Additionally, watershed cities now recognize the benefits of mowing, rather than discing, weed setback zones likely to erode and promote the use of drought-resistant, native plants in new landscape plans. These measures highlight the increased awareness among city and county agencies about the sources and importance of balancing erosion control with fire regulation needs.

**Moderate Progress**

Five actions under *Land Use* have realized moderate success although three of them are considered low-moderate. These five actions include:
• Reduce accelerated sedimentation caused by human activities;
• Implement confined animal BMPs (low-moderate);
• Balance public access and resource protection (low-moderate);
• Eliminate habitat fragmentation (low-moderate); and
• Enforce camping restrictions on parklands.

**Reduce Human-based Accelerated Sedimentation (#10)**

Efforts to reduce human-based accelerated sedimentation include: 1) passing local ordinances for development projects and enforcing these measures, 2) minimizing the loss of topsoil, 3) preventing roadside dumping of dirt, and 4) eliminating massive grading. Some of these actions have realized greater success than others. For example, in the past few years local ordinances addressing sedimentation control measures have been passed by all watershed cities, which is a milestone achievement. Furthermore, the Regional Board requires all development projects greater than five acres to obtain a Construction NPDES permit and to implement sedimentation control measures. However, enforcing these ordinances and BMP requirements has been relatively inadequate. With few exceptions, on average city inspectors are visiting construction sites required to implement sedimentation control BMPs only once during the rainy season, and the Regional Board lacks sufficient staff resources to conduct regular inspections of large development projects to ensure that pollution control BMPs are being implemented. The mechanisms to control and/or reduce accelerated sedimentation are in place, but enforcement of these measures is not readily occurring.

**Implement Confined Animal BMPs (#18)**

Among other things, this action calls for setting limits on the number of livestock per acre to protect resources from overuse by large animals, such as horses. Malibu has established limits based on the location of a parcel within the city. The County of Los Angeles Department of Health Services also inspects stables with four or more horses on a yearly basis to determine whether appropriate BMPs are being implemented and to ensure that horse waste is well contained and prevented from reaching creeks. Their surveys confirm that there is definitely a problem with manure waste management in the watershed. Although horse owners are required to ensure that no manure-contaminated runoff reaches adjacent streams and that no stalls are within 50 feet of a stream bank, enforcement of these measures is minimal due to DHS’s limited staff resources. Some horse owners simply have not implemented adequate setback zones and pollution control BMPs, and their horse waste is still reaching and polluting adjacent streams in the Malibu Creek watershed.
The steps needed to accomplish this action are not well defined, and thus what has been reported in Section II of this report is limited. Only a few plans have specifically addressed both resource protection and public access issues. These include the Resource Conservation District’s restoration efforts in Malibu Lagoon and the upcoming Las Virgenes Canyon sub-watershed study. A more comprehensive plan focusing on how to minimize the impacts of residents, hikers, horseback riders and campers on the watershed’s creeks, streams and sensitive habitats would be a good starting point towards balancing public access needs with resource protection goals.

**Eliminate Habitat Fragmentation (#35)**
Steps to improve and/or maintain continuous habitats for native species in the watershed have been somewhat limited in scope, and city master plans have focused on other regional impacts of population growth. However, the City of Calabasas’ designation of *Open Space Districts* is a creative approach towards reducing habitat fragmentation, and other cities should be encouraged to designate similar districts within their own jurisdictions.

Also, the study initiated by the National Park Service and the California Department of Parks and Recreation four years ago has proved to be a key step in understanding the impacts that habitat fragmentation can have on native species. Over the next several years, the data gathered will be very useful in guiding park planning and habitat preservation efforts.

**Enforce Camping Restrictions (#41)**
Transient camping is not a significant problem in the Malibu Creek watershed, or on State Parks properties, and thus efforts to control it are minimal. As stated in Section II, State Parks personnel does patrol parklands and takes action as necessary.

---

**Minimal Progress**

*Create/Maintain Buffer Zones for Sensitive Areas (#34)*
While a few agencies have created buffer zones to protect sensitive habitats and prevent urban encroachment within their agency boundaries, the majority of the watershed’s sensitive habitats are not well protected. Watershed cities have lagged in their efforts to protect sensitive habitats and setback requirements called for under municipal ordinances are inadequate to protect riparian habitats and stream corridors from development activities. Development projects located too close to stream and riparian corridors lead directly to increased sedimentation, spreading of invasive species and
increased trash and debris. Better efforts at the municipal level should be made towards creating adequate buffer zones in the watershed.

**Land Use Management Grade: C-**
Goal: Restore and Protect the Watershed’s Habitats

A total of 15 actions address the need for habitat protection and restoration in the Malibu Creek Watershed. These actions range from purchasing land containing sensitive habitats to preventing sedimentation and the proliferation of exotic species. As the chart to the left shows, collectively low-to-moderate success has been achieved towards restoring, enhancing and protecting the watershed’s habitats and resources.

Substantial Progress

Of the 15 actions in this section, only two have achieved substantial progress in protecting the watershed’s habitats. They include:

- Fire regulation and erosion control;
- Mitigate the impacts of Pacific Coast Highway bridge reconstruction on habitats.

Fire Regulation & Erosion Control (#11)

Development and implementation of the Fire Department’s Fuel Modification Program was a significant achievement in reconciling public safety with resource and habitat protection. The program’s grass height allowances, planting requirements and long-term vegetation maintenance plan help to minimize the erosion and sedimentation caused by excessive brush clearance and mowing practices. Combined, these measures are improving habitats located near developments and are helping to prevent the downstream impacts resulting from uncontrolled erosion and sedimentation.

Mitigate the Impacts of PCH Bridge Reconstruction (#26)

CalTrans established a mitigation fund to help improve various habitats around the Pacific Coast Highway bridge which crosses Lower Malibu Creek and Lagoon. Three very successful projects in the lower watershed were implemented as a result of this mitigation fund: 1) salt marsh restoration (State Parks); 2) five year monitoring of the tidewater goby (RCDSSM); and 3) the Effects of Sand Breaching the Sand Barrier on Biota study (RCDSSM). Because CalTrans has met its mitigation requirements, this action is considered fully and successfully completed. Additional lower creek and lagoon restoration efforts are addressed in several other actions throughout this report.
Moderate Progress

Four of this section’s 15 actions have achieved moderate progress towards protecting the watershed’s habitats. These include:

- Reduce accelerated sedimentation;
- Restore Malibu Lagoon;
- Assess lagoon characteristics; and
- Eliminate habitat fragmentation.

**Reduce Human-based Accelerated Sedimentation (#10)**
Efforts to control human-induced sedimentation from urbanized areas have been moderately successful, due primarily to: 1) increased public education efforts focused on developers and contractors, 2) adoption of local ordinances by watershed municipalities and 3) enforcement of construction-related BMPs. These efforts could also be improved through enhanced enforcement activities, mowing rather than discing areas likely to erode and educational outreach specifically targeting residential communities about the need for smart landscaping to protect the watershed’s habitats from neighborhood-based sedimentation.

**Restore Malibu Lagoon (#20)**
The components essential to restoring Malibu Lagoon are numerous and complex. Already, a significant amount of attention has been given to the “need” to restore the lagoon, and many studies have been conducted over the years to help assess the extent of the problems associated with the area. This increased level of understanding about the impacts earned this action a moderate rather than minimal ranking. It is a critical first step towards any restoration plan. However, until now actual restoration efforts have been piecemeal, such as increasing the available habitat for migratory birds and the tidewater goby, restoring the salt marsh area, removing trash and debris, and construction of a storm water treatment and disinfection facility at the end of the mystery drain. A comprehensive plan must be developed detailing all of the steps needed for full restoration.

As mentioned in the body of the report, the Lower Malibu Creek and Lagoon Task Force is currently in the process of prioritizing the alternatives contained in the UCLA report and developing a restoration plan. Although not complete at the time of this report, their efforts are aggressively moving along. Once priorities are developed, the group will start seeking funds to implement those measures chosen.

**Assess Malibu Lagoon Characteristics (#21)**
The primary objectives in assessing Malibu Lagoon’s characteristics are to evaluate and establish water quality criteria and habitat needs. The complement to this activity lies in determining how those characteristics actually affect/impact habitats. As
mentioned under both Establishing Minimum Biological (habitat) Standards and Restore Malibu Lagoon above, several studies have occurred to increase our understanding of the biological condition of the Lagoon, including the degree to which habitats are impaired. However, not all species have been considered in the characterization and there are still gaps in data which need to be filled — in particular, the physical tolerances of key species and the degree to which pollutants adversely affect these species. For this reason, the progress made under this action is considered moderate.

Eliminate Habitat Fragmentation (#35)
While the threat of habitat fragmentation does exist in the Malibu Creek Watershed, the fact that nearly 80% of the watershed is open space helps lessen that threat. The studies undertaken to evaluate the impacts of urban encroachment on habitats and to address critical concerns of carnivores are being used to direct and promote wildlife conservation efforts. Cities, recognizing the need for open space and habitat linkage preservation, are starting to incorporate these concepts into their master plans and to identify land parcels most desirable for acquisition to meet this goal. If acquired, the parcels identified by State Parks will also help reduce habitat fragmentation. And lastly, the on-going educational and awareness efforts targeting city planners and permitting departments should help guide habitat preservation efforts.

Minimal Progress

Nine actions, more than one-half of the total under Habitats, have made little or no implementation progress. These include:

• Establish minimum biological (habitat) standards;
• Establish water temperature policies for fisheries;
• Regulate lagoon water levels;
• Public access and resource protection;
• Purchase high priority lands for watershed protection;
• Develop buffer zones for sensitive areas;
• Control exotic vegetation in the wilderness;
• Remove barriers to fish migration; and
• Maintain, restore and create wetlands.

Establish Minimum Biological (habitat) Standards (#5)
Because of the monitoring efforts of many organizations, including the RCDSMM, Las Virgenes Municipal Water District and Coastal Conservancy/UCLA study, there is a greater understanding of the biological condition of the watershed’s target and endangered species. However, no studies have been conducted to comprehensively assess the range of tolerances of these species. Although it may prove impossible to
actually optimize the habitat needs for each of the target species, particularly in the lower creek and lagoon area, establishing their minimum needs would provide a good starting point from which to set biological standards.

**Establish Water Temperature Policies (#12)**

Despite the Las Virgenes Municipal Water District’s temperature data for steelhead trout and Resource Conservation District’s decade-long Malibu Lagoon temperature data, no recommendations have been made about what the optimum water temperature should be for habitats and species in the Malibu Creek watershed. And, no studies have been conducted to determine the temperature tolerances of the watershed’s local key/indicator species.

In its thermal plan, the State sets temperature limits for industrial and treatment plant discharges such as Tapia’s effluent. However, such discharges into the Malibu Creek watershed are not a concern because they are well below the limits established by the State. Of greater importance to aquatic species such as steelhead trout is the overall quality of the water, its flow characteristics and whether there is sufficient habitat (e.g., deep pools, upstream spawning grounds) to support native populations.

Notwithstanding the lack of effort, it’s not clear that establishing a water temperature policy is needed for Malibu Creek given its current state.

**Regulate Lagoon Water Levels (#24)**

Perhaps one of the most difficult issues facing the Lower Malibu Creek and Lagoon area has been how to regulate water levels in the lagoon. The unnaturally high water levels found in the lagoon during the dry season affect the hydraulic gradient in and around the lagoon, and this alteration causes many problems. Nearby septic systems become backed up, pollutants become more mobile in groundwater, bacteria counts increase, lagoon salinity decreases and mudflats (bird habitat) disappear. The need to regulate or control lagoon water levels is of critical concern for these and other reasons.

Prop A funds ($1,275,000) were awarded to State Parks and the City of Malibu in 1998 to develop a project to regulate lagoon water levels. Because Malibu is no longer participating in this effort, State Parks has taken on the leadership role in solving this problem. However, progress has been extremely slow. State Parks released a Request for Proposals in September, 1999 seeking a sound water level management plan/design and since that time several management alternatives have been discussed. However, a preferred alternative has not been selected and no project has been implemented as of yet. For this reason, this action has been given a minimal rating.
Public Access and Resource Protection (#32)
A balance must be maintained between allowing public access to open space while protecting sensitive habitats in the watershed. Unfortunately, this action has not received much attention until recently. Recognizing the need for balance, State Parks and a few watershed cities have begun to implement resource protection measures such as establishing access trails, erecting informative signs and outlining critical measures to be addressed (e.g., wildlife corridors and recreational needs) in city master plans. Still, local habitats are not adequately protected from community recreational activities. For example, allowing public access to the mud flats in Malibu Lagoon jeopardizes bird safety because some visitors bring their dogs and allow them to roam off-leash. Riparian habitats are trampled on by horses and hikers who may not realize that they are in sensitive areas. And, trash is left on the ground in parks which further impacts wildlife and aquatic habitats. Implementing measures that would fully protect sensitive habitats is not a popular idea as it would most likely require prohibiting public access completely. Therefore, a more attention must be given to this action and a plan developed that adequately balances public access with resource protection needs.

Purchase High Priority Land for Watershed Protection (#33)
This action has made little progress on three accounts. First, there has not been a comprehensive, publicly available assessment of which lands within the entire watershed would be the most desirable to acquire from a water quality/habitat prospective. Secondly, there has been little effort made to actually acquire key parcels, or to secure the funds to do so. And thirdly, there has not been an abundance of willing sellers. Obtaining some parcels which have long been sought after, such as the golf course adjacent to Malibu Lagoon, has proved impossible thus far. This action, in some sense, has found itself in a “catch 22” scenario. A seller isn’t willing to open discussions about selling his/her land unless funds are available to purchase it, and government agencies will not allocate funds unless the landowner is a willing seller.

Additionally, the few parcels that have been identified as desirable for acquisition have not been selected as part of a greater watershed protection effort. Rather, they represent singular potential restoration opportunities. As an example, the City of Malibu is assessing the feasibility of acquiring land for a constructed wetland in the Civic Center area. While this is an important location, it has not been officially prioritized as the most important parcel for acquisition in Malibu. A comprehensive plan which prioritized parcels for acquisition and determines the likelihood of obtaining them would eliminate this problem.

Develop Buffer Zones for Sensitive Areas (#34)
With a few exceptions, little attention has been given to the importance of creating buffer zones and to identifying sensitive zones throughout the watershed which are in
need of buffer areas for protection. And, local ordinances for buffer zone setbacks (up to 100 feet) are inadequate to protect streams and creeks within the watershed. A few buffer zone areas have been identified on State Parks property and land has been purchased near the Rancho composting facility, but this falls far short of protecting many of the sensitive areas throughout the 109 mi² watershed. Although the creation or designation of open space zones should help protect sensitive areas contained in these zones, its benefits will not be realized unless there is a real commitment from the watershed’s cities to designate open space zones. Like the recommendation to prioritize land parcels for acquisition, a comprehensive survey of significant ecological areas should be conducted and a priority list developed which is specific to the habitat protection needs of the Malibu Creek watershed.

*Remove Barriers to Fish Migration (#36)*
Efforts to address this action started several years after adoption of the Bay Restoration Plan and the Natural Resources Plan, and began with the formation of the Steelhead Recovery Task Force. In Malibu Creek, there are two primary obstacles impeding steelhead’s migration to upper reaches of the creek. These include the Arizona crossing at Cross Creek and Rindge Dam.

**Arizona Crossing at Cross Creek**
A few years ago, there were discussions about removing this particular obstacle to steelhead migration. However, plans have all but been dropped because funding was never secured to alter the crossing. Only recent passage of Prop 12 has sparked new interest regarding how the crossing could be changed to benefit steelhead trout migration upstream.

**Rindge Dam**
Although Rindge Dam has not been removed, the fact that the Army Corp of Engineers has conducted a reconnaissance study to confirm local support for the project was a very positive initial step. However, a feasibility study (which has yet to start) needs to be conducted to assess the various restoration alternatives. The Army Corps has appropriated $400,000 for this feasibility study and State Parks will be providing the necessary matching funds. Current cost estimates to remove Rindge Dam, based on several alternatives already proposed, range between $10-30 million. Still, it remains to be seen which restoration alternatives will actually be presented and whether enough funds will then be secured for the alternative ultimately selected.

**Maintain, Restore and Create Wetlands (#38)**
The majority of interest in maintaining, restoring and creating wetlands has been in the lower watershed, in areas including Malibu Lagoon and the Civic Center area. With the exception of the LVMWD’s rehabilitation of a percolation pond as a constructed wetland and some restoration of Malibu Lagoon, no other wetland restoration efforts
have been implemented. Part of the reason for this stems from a lack of funds to start such a project. Also, there is some controversy over just which areas are considered “historic wetlands” and can be rehabilitated, and which areas can even be restored given current development obstacles.

**Control Exotic Vegetation in the Wilderness (#37)**

As mentioned in the body of the report, controlling the spread of exotic vegetation in the watershed is an overwhelming and endless task, and the resources needed to conduct this activity successfully haven’t been available. While there are certainly some vigilant efforts by State Parks, Weed Warriors and other volunteer groups, the problem is so great, and some species so prolific, that it seems that it will be all but impossible to permanently remove exotic species. Also, the success of removing one particular invasive species, Arundo donax, is reduced because the target areas for removal are downstream from other upstream patches of Arundo. Unfortunately, the funds made available for this activity limited the geographical area from which Arundo could be removed.

The newly formed Invasive Species Task Force plans to start addressing the need to identify, assess and initiate removal of many types of invasive species. Perhaps their efforts, along with the availability of Prop 12 bond funds will lead to more successful removal of exotics.

---

**Restore and Protect Watershed Habitats Grade: D-**
Goal: Improve Coordination & Outreach Among Watershed Stakeholders

Overall, the 7 actions designed to improve Coordination and Outreach have been quite successfully implemented. The goals and objectives of these actions has been: 1) to improve communication and coordination efforts among stakeholders, public agencies and the general public, 2) to better educate the public about sources of pollution and what they can do to minimize the impacts of pollution on the watershed’s resources, and 3) to combine monitoring resources to better understand watershed dynamics and impacts. Following is an assessment of progress achieved in meeting the goals of these actions.

Substantial Progress

Some of the more notable achievements have been in the areas of:

- Posting public notices regarding lagoon breaching, and publishing bacteria monitoring results and potential human health concerns;
- Promoting composting, conservation and recycling programs in the watershed through curbside recycling programs, household hazardous waste roundups, educational brochures, PSAs and workshops (just to name a few);
- Coordinating restoration and protection efforts on a watershed basis; and
- Implementing public education programs.

Post Public Notices (#25)

Public access to and understanding of information available on the quality of water in Malibu Creek and Lagoon has dramatically increased in the last five years. This is due to a number of factors, including: 1) regular and frequent posting of Heal the Bay’s Beach Report Card through multiple venues, 2) improvements in bacterial monitoring, and 3) local newspaper coverage. The results of the Santa Monica Bay Restoration Project’s Epidemiological Study also helped improve the protocol for advising the public of health risks associated with swimming in contaminated waters. While the public is made aware of the health risks associated with swimming in the ocean within three days after a rain event through the media, the study provided the information needed to scientifically back up the recommendations and led to revisions in the County’s Beach Closure and Health Warning protocol. The study also
led to passage of AB 411, which requires local health agencies to set up a hotline informing the public of closed, posted or restricted beaches. Together, these actions have effectively improved the public’s awareness about the water quality and risks associated with swimming in shoreline waters adjacent to Malibu Creek and Lagoon.

**Composting, Recycling and Conservation Programs (#29)**

As mentioned under *Managing Solid Waste* (starting on page 99), an enormous amount of energy has gone into promoting composting, recycling and conservation awareness among watershed residents. All watershed cities offer some sort of recycling program, whether it be curb-side pickup, roundup events or permanent drop-off sites. Additionally, these recycling opportunities are promoted through city newsletters, public service announcements, local cable channels and city banners. The need for water conservation is also promoted through educational workshops, fliers, newsletters and bill inserts. Combined, these efforts have increased the public’s awareness for the need to recycle and conserve.

**Coordination Efforts (#39)**

The formation of the Malibu Creek Watershed Council has led directly to many of the achievements highlighted in this report. The continued involvement of participating organizations listed in Table 1.1 on page 5 has also led to a better understanding of the dynamics of the watershed and has provided a reliable mechanism for restoring habitats, assessing water quality and protecting species in a constructive, cohesive manner. While implementation has been slow for many actions, it would have been virtually impossible to achieve the progress already made without the long-term commitment of council members working together.

The progress made to coordinate activities among different agencies with seemingly conflicting goals has also been a milestone achievement, which should serve as a model for other watersheds. In particular, reconciling brush clearing needs (fuel modification), flood control and roadside maintenance with preservation of habitats has led to revisions of past practices and establishment of new guidelines within the County Fire and Public Works Departments. The 1996 Municipal Storm Water NPDES permit has also proven to be another avenue for coordinating efforts between the County and cities in the Malibu Creek watershed. Although the activities called for in the permit are mandatory on an individual city basis, cities have realized and been motivated by the cost savings associated with forming partnerships. In particular, the formation of the Council of Governments (see Coordinate on a Watershed Basis, #39) reinforces the advantages of creating such partnerships.
Public Education Programs (#42)
Public education programs targeting watershed residents and businesses have been broad in both message and approach. Many new outreach avenues have become successful realities in recent years, including use of the internet, creation and circulation of city/utility newsletters, use of real-time data, increased numbers of roundups and collection events, and an ever-growing number of hands-on programs and activities (e.g., student field trips, residential gardening workshops, volunteer opportunities, commercial site visits, municipal training and workshop classes, etc.). Additionally, several public education programs have successfully targeted very specific user groups. Examples include: 1) the Resource Conservation District of the Santa Monica Mountains’ Stable and Horse Management BMP Manual; 2) the Las Virgenes Municipal Water District’s water conservation classes for landscape maintenance companies; and 3) State Parks’ lectures for teachers on the values of and need to preserve open space.

Moderate Progress

Moderate progress has been achieved in areas such as:

- Implement confined animal BMPs;
- Promote water conservation practices; and
- Implement coordinated monitoring programs

Implement Confined Animal BMPs (#18)
The RCDSMM conducted an extensive survey to identify the horse owners and corrals in the Malibu Creek watershed. They then used the information to produce pollution prevention educational materials for this target group. While the outreach materials are very informative, it’s not clear that they are effectively reaching horse owners and are leading directly to changes in habit among them. Many corrals are still placed too close to streams and creeks, management of horse waste is still not closely regulated and people are still riding their horses in adjacent creeks. More outreach using the tools now available is still needed.

Promote Water Conservation (#30)
Because virtually all of the water used by watershed residents is imported, conservation measures are vitally important to both protecting and sustaining natural habitats. The LVMWD has implemented several educational approaches to promote water conservation measures which would reduce the amount of water used by households, including: 1) installation of ultra low-
flow toilets, 2) workshops promoting low water use plants and landscape, and 3) distribution of educational materials promoting water conservation. However, the watershed’s population continues to increase and even more must be done to encourage households to install ultra low-flow toilets (the single largest indoor use of water), and to more closely monitor landscape irrigation needs and other activities which cause excessive runoff.

**Coordinated Monitoring Programs (#43)**

There is an enormous amount of recent and historic monitoring data available for waterbodies in the Malibu Creek watershed, and significant steps have been taken towards collectively integrating the watershed’s monitoring activities. Independent studies and routine monitoring activities have also enhanced our understanding of the major pollution issues. However, this data has yet to become available through a centralized, user-friendly database, and it has never been analyzed as a whole. Heal the Bay has only recently received funding for and started to create a database of the monitoring activities of key agencies. And, although the Monitoring and Modeling Subcommittee released a plan detailing a coordinated, watershed-wide monitoring program, it has yet to be implemented. Its implementation depends on securing the funds needed to carry out each component of the plan. Future progress will require adequate resources to realize the goals of the coordinated monitoring plan developed.

**Coordination and Outreach Grade: A-**
SECTON IV:
MOVING FORWARD WITH RESTORATION PRIORITIES

Significant achievements have been made over the past decade to restore the Malibu Creek watershed. Still, much remains to be done to improve its water quality, habitats and living resources.

This chapter provides a summary of priority watershed restoration and protection activities which will advance the Malibu Creek watershed Action Plan.

The 29 priorities listed (Table 4.2) are based on the assessment of progress contained in this report. From this list, the Malibu Creek Watershed Executive Advisory Council has identified a list of “Top Ten” priorities (Table 4.1). How well and how extensively these actions are implemented will depend on many things, including: 1) availability of funds to carry out programs, 2) policy changes and/or legislation, 3) availability of research data to move actions forward, 4) ability to acquire land, and most importantly, 5) ensuring stakeholder involvement.

This Top-Ten list is not intended to be static or even an exhaustive list of all the watershed’s priorities. It is anticipated that priorities will change as actions are implemented and new issues arise.

### “TOP TEN”
Watershed Restoration Priorities

1. Map all existing and potential sources of pollution in the watershed. Implement measures to pinpoint sources of pollution in both the upper and lower watershed.
2. Acquire key parcels of land for habitat protection.
3. Remove Arundo donax from the entire watershed.
4. Review general land use practices and past practices for each city and for unincorporated areas in the watershed to predict the impacts on public health, natural and aquatic resources, and recreational benefits.
5. Reduce sedimentation and erosion along stream banks, roadways and at construction sites.
6. Implement the coordinated watershed-wide monitoring plan developed by the Monitoring and Modeling subcommittee and develop a centralized database for the monitoring data.
7. Synthesize water quality data to establish minimum standards for native species of locality and identify where gaps in data still exist.
8. Develop/revise monitoring plan to address data gaps.
9. Develop a plan to identify, remove and prevent exotic plant and animal species from impacting the watershed.
10. Help/Encourage watershed cities to develop uniform development plans and ordinances which would:
   - Set slope minimums for hillside building and construction activities.
   - Establish native plant vegetation requirements
   - Prevent disturbances to natural drainage channels
   - Retain runoff on-site to the maximum extent practicable (including use of pervious surfaces)
   - Prevent sediment loadings to creeks/streams both

### 7. Encourage watershed municipalities to integrate a watershed planning perspective into General Plans and local ordinances. Concepts to be considered include:

- Setting slope minimums for hillside building/construction;
- Establishing native plant vegetation requirements;
- Preventing disturbing natural drainage channels;
- Minimizing habitat fragmentation;
- Retaining runoff on-site to the max. extent practicable (including pervious surfaces requirements for new and substantial redevelopment projects);
- Preventing sediment loadings to creeks/streams both during and after construction;
- Cumulative watershed-based review of development projects;
- Setting standards for streets, sidewalks, driveways and parking lots;
- Establishing 200-ft buffer-zone standards near sensitive habitats; and
- Establishing setback standards for corrals and stables located near creek and stream banks.

### Watershed Studies and Research

8. Map all existing and potential sources of pollution in the watershed and use measures to pinpoint exact sources of these pollutants. In particular, identify all sources and relative contributions of pathogens and nutrients.

9. Identify and develop a monitoring program to fill gaps in data where they exist throughout the watershed.

10. Establish TMDLs for pollutants of concern in the Malibu Creek watershed.

11. Establish minimum biological standards (habitat needs) for native species. Consider the physical tolerances of birds, plants and aquatic species.

12. Evaluate the impacts of breaching on Malibu Lagoon aquatic species and birds. Design a lagoon water level management plan based on this research.

<tbody>
<tr>
<td><strong>Best Management Practices</strong></td>
<td>Activities, practices, facilities and/or procedures that when implemented to their maximum efficiency will prevent or reduce pollutants in discharges.</td>
</tr>
<tr>
<td><strong>Bathymetry</strong></td>
<td>The science of measuring the depths of the ocean, seas, etc.</td>
</tr>
<tr>
<td><strong>Benthic</strong></td>
<td>Organisms living on or in the sea floor.</td>
</tr>
<tr>
<td><strong>Bio-criteria</strong></td>
<td>Narrative descriptions or numerical values that are used to describe the reference condition of aquatic biota inhabiting waters of a designated aquatic life use. These criteria are used to determine if waters are affected by chemical pollution or other factors.</td>
</tr>
<tr>
<td><strong>Biosolids</strong></td>
<td>The solids portion of human waste removed through primary treatment of wastewater. Formerly called sludge.</td>
</tr>
<tr>
<td><strong>BOD</strong></td>
<td>Bio-chemical Oxygen Demand. The amount of dissolved oxygen needed to decompose organic matter in wastewater. A high BOD indicates an impaired waterbody with little oxygen remaining for aquatic life.</td>
</tr>
<tr>
<td><strong>Breach (lagoon)</strong></td>
<td>Naturally or artificially breaking open the sand barrier that separates Malibu Lagoon from Santa Monica Bay.</td>
</tr>
<tr>
<td><strong>Carnivore</strong></td>
<td>Any of an order of fanged, flesh-eating mammals including the dog, bear, cat and seal.</td>
</tr>
<tr>
<td><strong>Catch Basin</strong></td>
<td>A sieve-like device at the entrance to a storm drain system to stop matter from entering which could block up the system.</td>
</tr>
<tr>
<td><strong>Clean Water Act (CWA)</strong></td>
<td>The Federal Water Pollution Control Act enacted in 1972 by public law and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to waters of the United States unless said discharge is in accordance with an NPDES permit.</td>
</tr>
<tr>
<td><strong>Coliform</strong></td>
<td>Relating to, resembling or being the aerobic bacillus normally found in the colon of humans and animals. A coliform count is often used as an indicator or fecal contamination of water supplies.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Delineation (wetlands)</td>
<td>Identification and/or outline an area which encompasses wetlands.</td>
</tr>
<tr>
<td>DO</td>
<td>Dissolved Oxygen. The amount of oxygen present in water. A low DO indicates an impaired waterbody with little oxygen remaining to support aquatic life.</td>
</tr>
<tr>
<td>Enterococcus</td>
<td>Any of a genus (streptococcus) of non-motile, usually parasitic, gram positive bacteria occurring in the intestinal tract that may be a cause of disease when found in other parts of the body.</td>
</tr>
<tr>
<td>Eutrophication</td>
<td>The process in which a nutrient-rich waterbody becomes degraded due to decreased levels of oxygen caused by excessive growth of bacteria. High eutrophication indicates an impaired waterbody with little or no oxygen remaining to support aquatic life.</td>
</tr>
<tr>
<td>Extirpate</td>
<td>To remove or destroy completely; exterminate; abolish.</td>
</tr>
<tr>
<td>Grey Water</td>
<td>Wastewater discharged from household sinks, showers, washing machines, dishwashers, etc. that does not come into contact with human waste.</td>
</tr>
<tr>
<td>Hydrology</td>
<td>The science dealing with the waters of the earth, their distribution on the surface and underground, and the cycle involving evaporation, precipitation, flow to the seas, etc.</td>
</tr>
<tr>
<td>Illicit Connection</td>
<td>Any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-storm water discharges except discharges pursuant to an NPDES permit and discharges that are exempted or conditionally exempted in accordance with section II of the 1996 Municipal Storm Water NPDES permit.</td>
</tr>
<tr>
<td>Macròinvertebrate</td>
<td>Larger animals without backbones or spines (e.g., shrimp, lobster).</td>
</tr>
<tr>
<td>MBAS</td>
<td>Methyl Buyl Activated Substances. Soap and/or detergent compounds which indicate human inputs into a waterbody. MBAS markers are often found in grey water discharges.</td>
</tr>
</tbody>
</table>
Morphodynamics  (Definition for this report only). The constantly changing hydrological conditions associated with the Lower Malibu Creek and Lagoon estuarine system; particular attention is given to the morphodynamics of sand bar formation and breaching occurrences, tidal regime, wave climate and creek flows.

Nonpoint Source Discharge  Discharge resulting from widespread, diffuse, or unidentifiable sources of contaminants that comes from more than one point which cannot be controlled or easily monitored.

NPDES  National Pollutant Discharge Elimination System. A permit issued by the US Environmental Protection Agency, State Water Resources Control Board or California Regional Water Quality Control Boards pursuant to the Clean Water Act that authorizes discharges to waters of the United States and requires the reduction of pollutants or sets pollutant limits in the discharges.

Nutrients  Elements necessary for plant growth. Nitrogen and phosphorus are the most common elements. Excess nutrients in waterbodies can stimulate plant and algae growth.

Pathogen  Any agent, especially a microorganism, able to cause disease.

pH  A symbol for the degree of acidity or alkalinity of a solution, which ranges from 0 to 14. A neutral substance will have a pH value of 7, which is the value of distilled water. Lower numbers are acidic and higher numbers are alkaline (basic).

Piezometer  Any of various instruments used in measuring pressure or compressibility (e.g., to measure water pressure)

Point Source Discharge  Discharge from single, known sources, such as publicly owned treatment works (POTWs) or industrial facilities, from which contaminants enter a waterbody.

Porter Cologne Act  An Act passed by the California legislature in 1967, to provide for the orderly and efficient administration of the water resources of the state. Periodic amendments have been made since its original adoption date.

Potable  Fit to drink; drinkable.

Primary Treatment  A treatment process in which the solids portion of wastewater is
allowed to settle out before the remaining effluent is discharged. This process does not remove suspended and colloidal matter.

**Proposition A Funds**

Bond funds totaling $8 million which were approved by Los Angeles County voters in 1994 and 1998. These funds are specifically earmarked for capital improvement projects to prevent or reduce urban runoff pollution from entering Santa Monica Bay and its watershed.

**Riparian Habitats**

Those habitats located adjacent to or living on the bank of a lake, pond, river, creek or stream.

**Secondary Treatment**

A biological treatment process in which effluent that has received primary treatment is further processed to remove about 85% of the BOD and suspended solids present (e.g., trickle filters or anaerobic digestion) before being discharged.

**Sedimentation**

The deposit or formation of sediment. Increased sedimentation into waterbodies can increase turbidity and smother natural spawning grounds.

**Spawning Grounds**

A location where eggs, sperm or young (offspring) are produced or deposited.

**Storm-ceptor**

An in-situ, non-mechanical device which is positioned to receive and separate out trash and other debris found in storm drain flows before they reach receiving waters.

**Taxonomical**

Classification of plants and animals into natural, related groups based on some common factor of each, as structure, embryology or biochemistry.

**Telemetry**

Transmission of measurements of physical phenomena, such as temperature, to a distant recorder or observer.

**Tertiary Treatment**

A treatment process in which effluent that has received both primary and secondary treatment is further processed to remove nutrients and most of the remaining suspended solids before being discharged.

<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Turbidity</strong></td>
<td>Muddy or cloudy water from having the sediment stirred up. Increased turbidity reduces the amount of light that can penetrate through the water column.</td>
</tr>
<tr>
<td><strong>US EPA 205(j) Grant Funds</strong></td>
<td>United States Environmental Protection Agency. Under section 205(j) of the Clean Water Act, grant funds are provided for water quality planning and assessment projects designed to prevent or reduce the release of pollutants into waters of the United States.</td>
</tr>
<tr>
<td><strong>US EPA 319(h) Grant Funds</strong></td>
<td>United States Environmental Protection Agency. Under section 319(h) of the Clean Water Act, grant funds are provided for nonpoint source implementation projects to reduce, prevent or eliminate water pollution and to enhance water quality for waters of the United States.</td>
</tr>
<tr>
<td><strong>WDR</strong></td>
<td>Waste Discharge Requirement. Waste discharge conditions adversely affecting waters of the state are regulated by the State and Regional Water Quality Control Boards under the Porter-Cologne Act. Permits, called Waste Discharge Requirements, are issued for discharges not covered under the federal NPDES permit (usually for non-surface water discharges).</td>
</tr>
<tr>
<td><strong>Xeriscape</strong></td>
<td>Dry landscaping.</td>
</tr>
